

ASTR/PHYS 2500: Foundations Astronomy

Week 8: Stars Some More

HW6 available, due Monday at 10:45am

Time to start thinking about your Communicating Science Projects!
<http://www.astro.utah.edu/~wik/courses/astr2500fall2020/projects.html>

Midterms not yet graded - hopefully later this week, but can't promise

2020 Physics Nobel Prize!

Proving that if GR is the correct theory of gravity, BHs are real

Andrea Ghez

Prize share: 1/4

Providing the best observational evidence for the existence of a BH - namely Sgr A*, the $4 \times 10^6 M_{\text{sun}}$ BH in the center of the Milky Way

Stars orbiting Sgr A*!

Classifying Stars

Stars have a mass, temperature or color, radius, and luminosity.
Can they have any combination of these properties?

Nope!

$$T_{\text{eff}} = \left(\frac{L}{4\pi R^2 \sigma_{\text{SB}}} \right)^{1/4}$$

$$R/R_{\odot} = 1.06(M/M_{\odot})^{0.945}, \quad M < 1.66M_{\odot}$$

$$R/R_{\odot} = 1.33(M/M_{\odot})^{0.555}, \quad M > 1.66M_{\odot}$$

$$T \approx \frac{9000 \text{ K}}{(B - V) + 0.93}$$

$$L/L_{\odot} = 0.35(M/M_{\odot})^{2.62}, \quad M < 0.7M_{\odot}$$

$$L/L_{\odot} = 1.02(M/M_{\odot})^{3.92}, \quad M > 0.7M_{\odot}$$

Luminosity vs Temperature

$$T_{\text{eff}} = \left(\frac{L}{4\pi R^2 \sigma_{\text{SB}}} \right)^{1/4}$$

But early on, no distances and no temperatures

Just spectral lines! And no quantum mechanics!!!

Harvard College Observatory

~1890

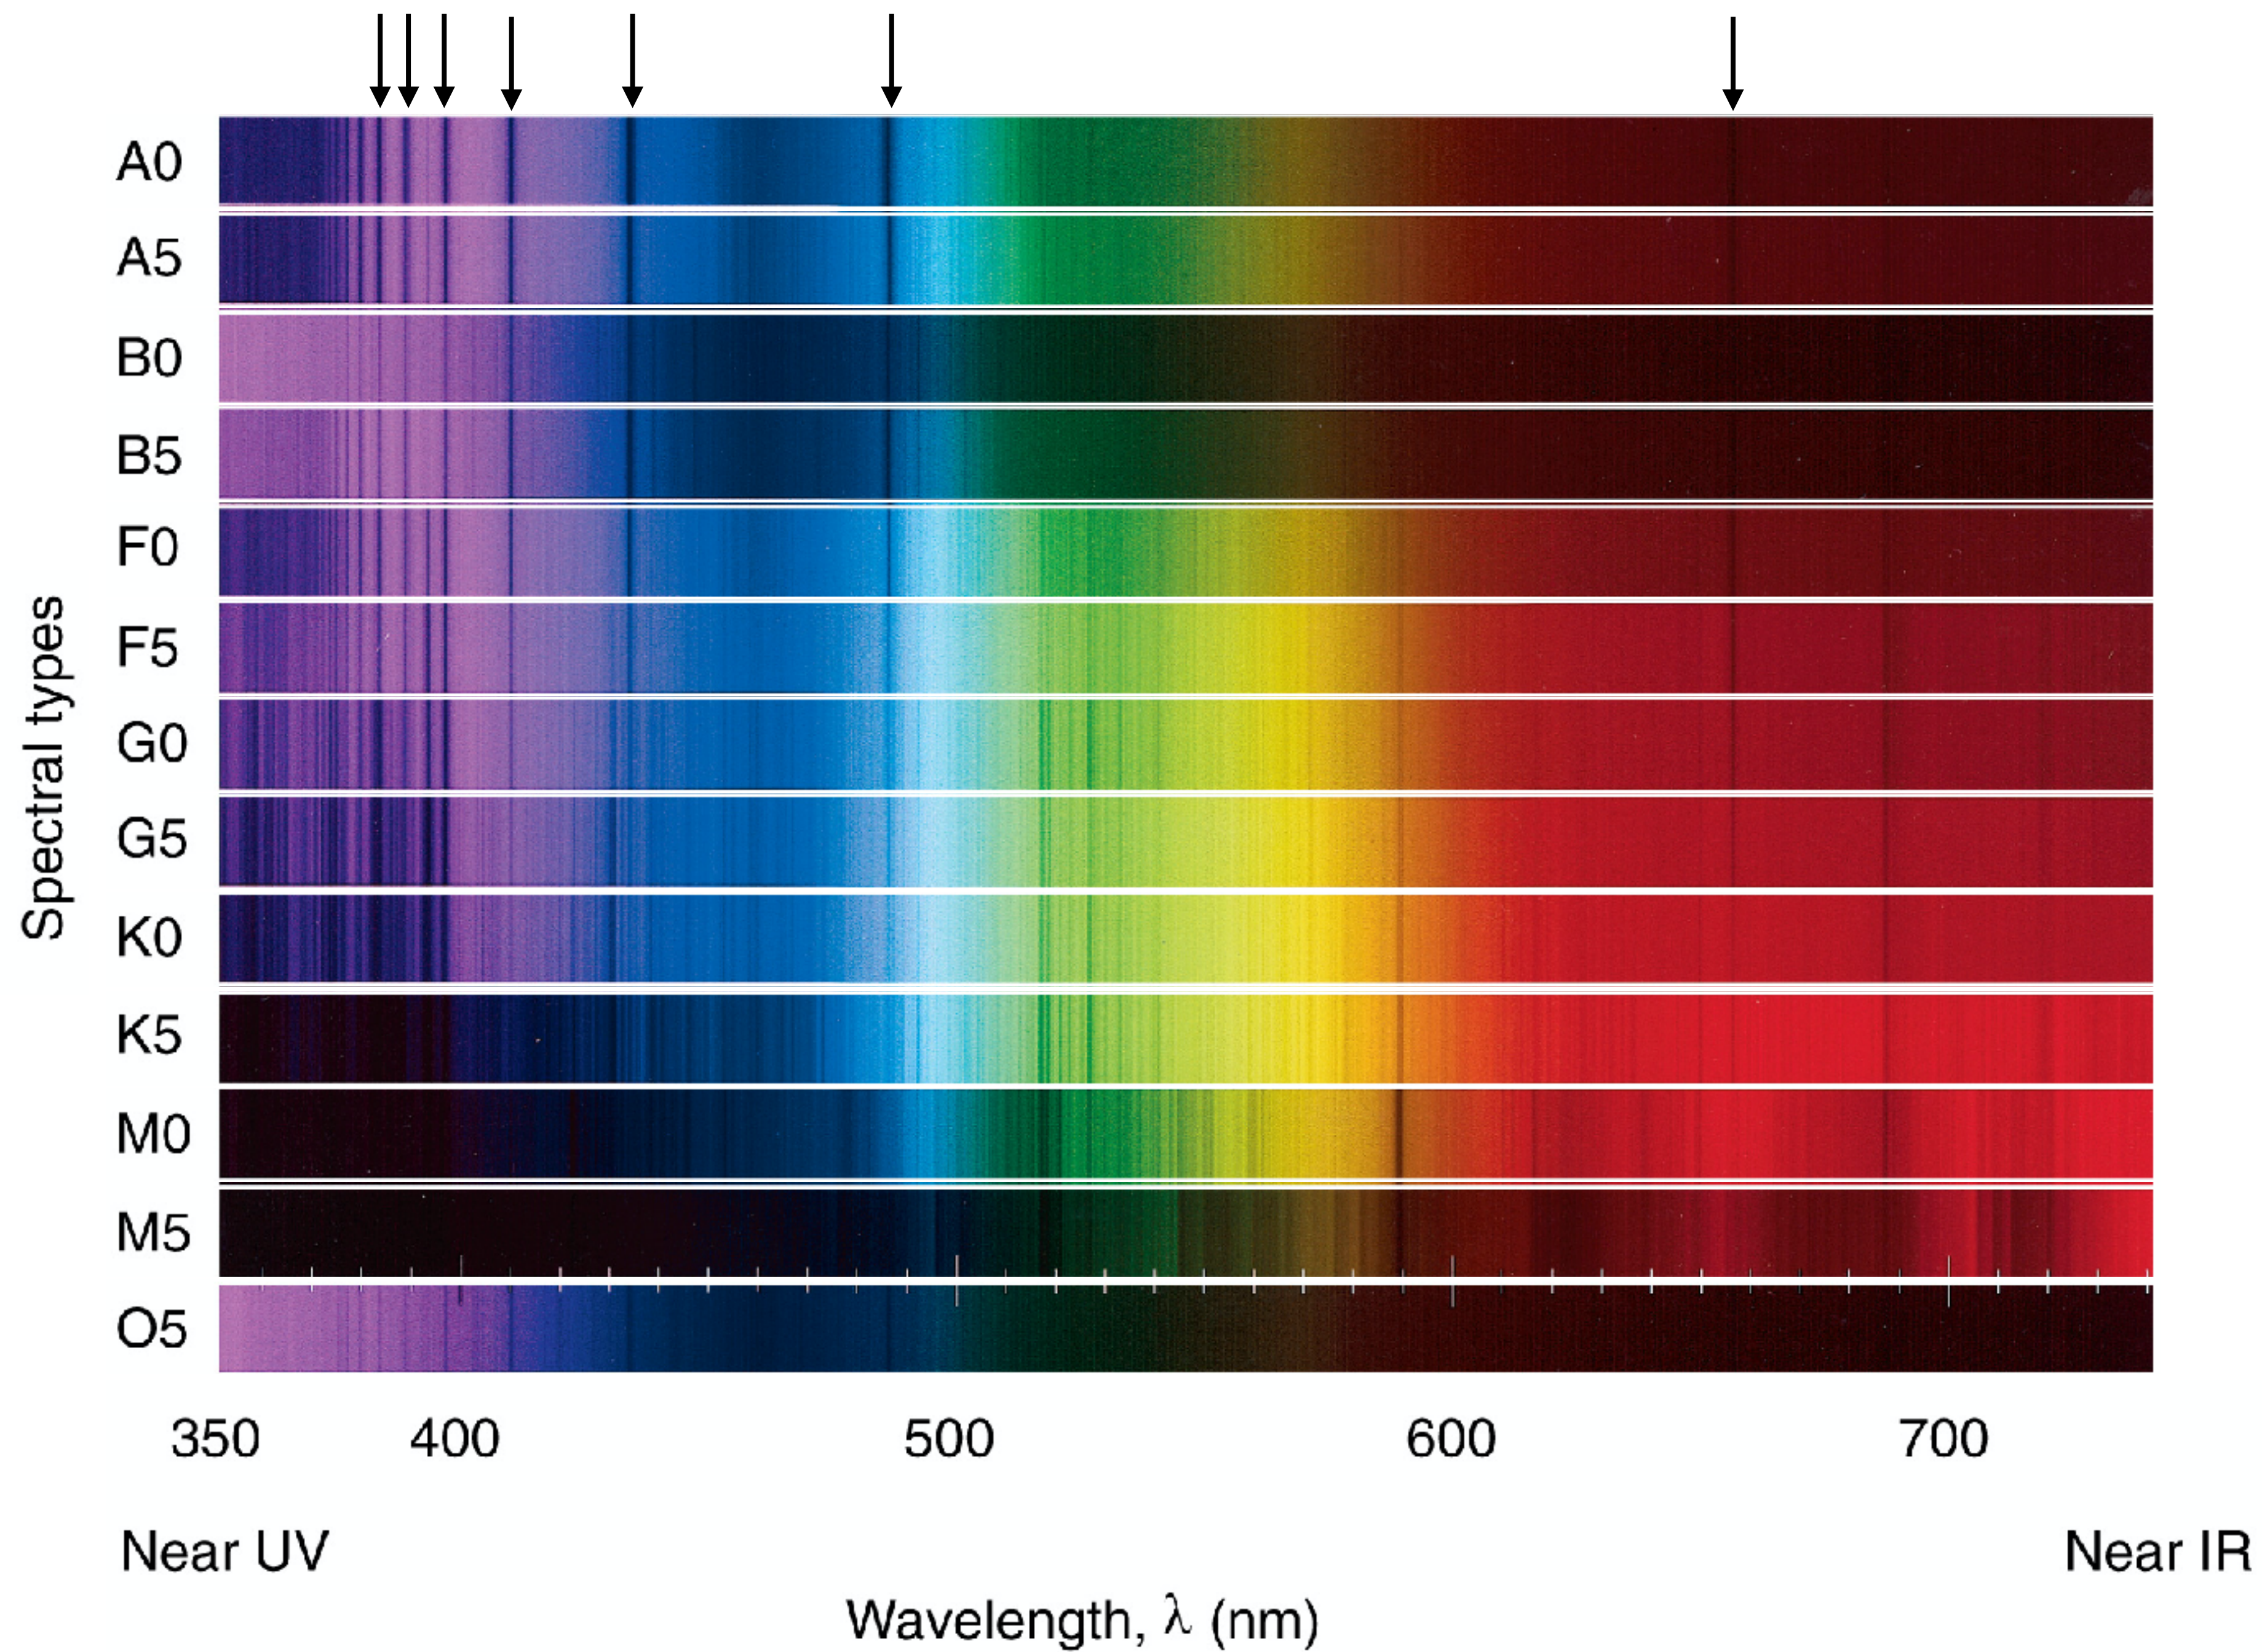

👎 “Pickering’s Harem” 👎

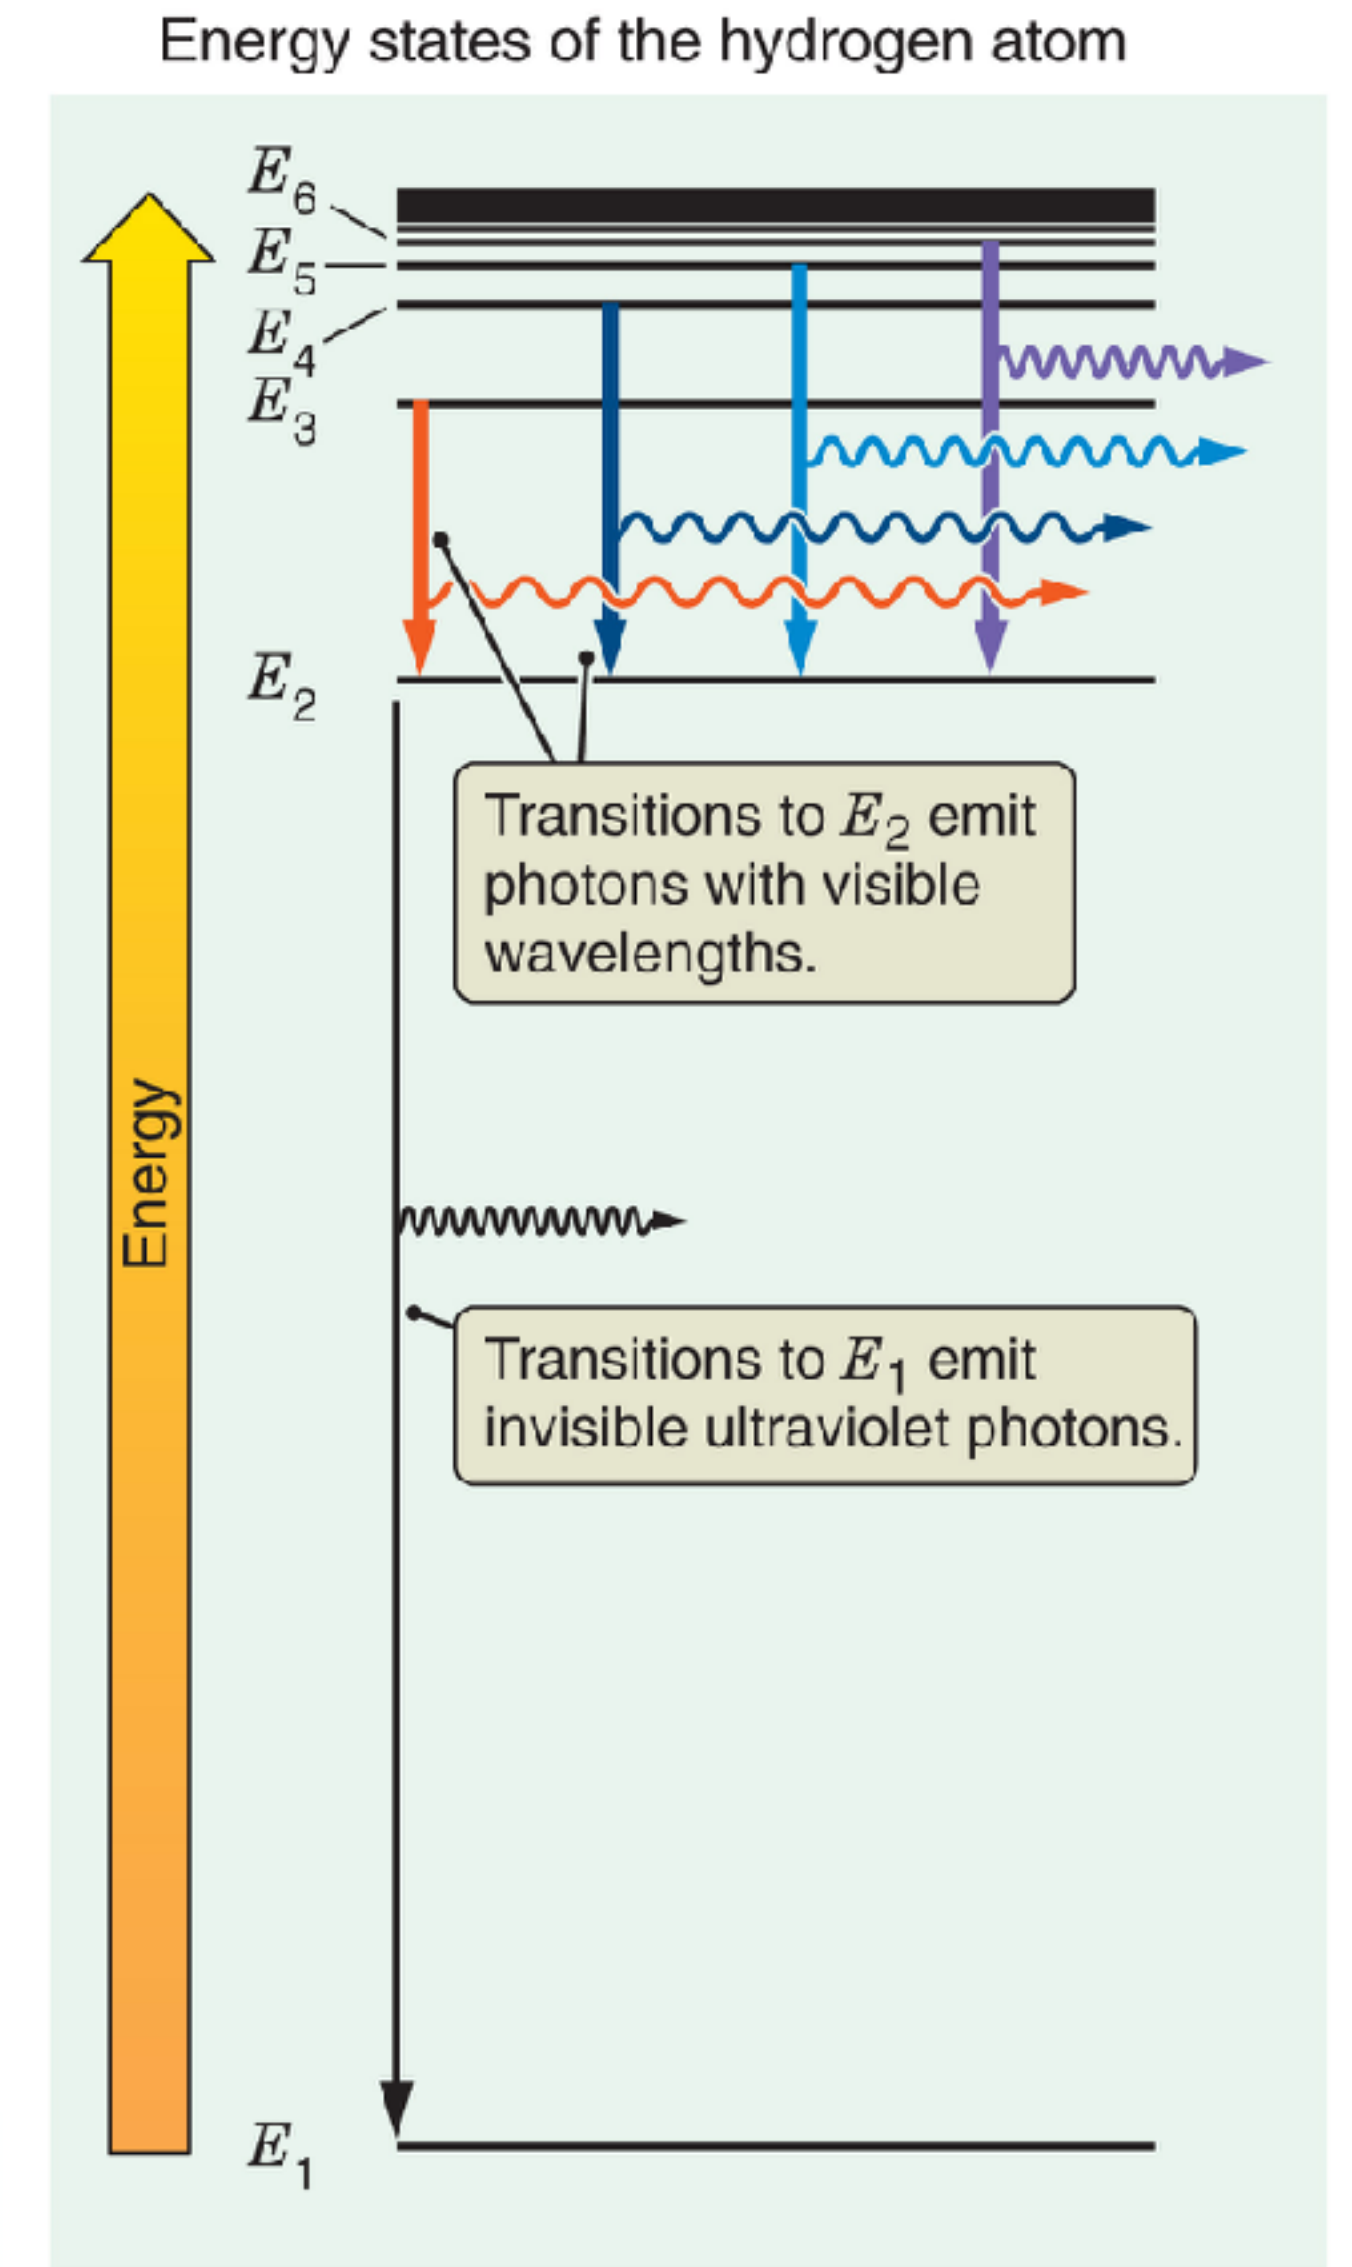

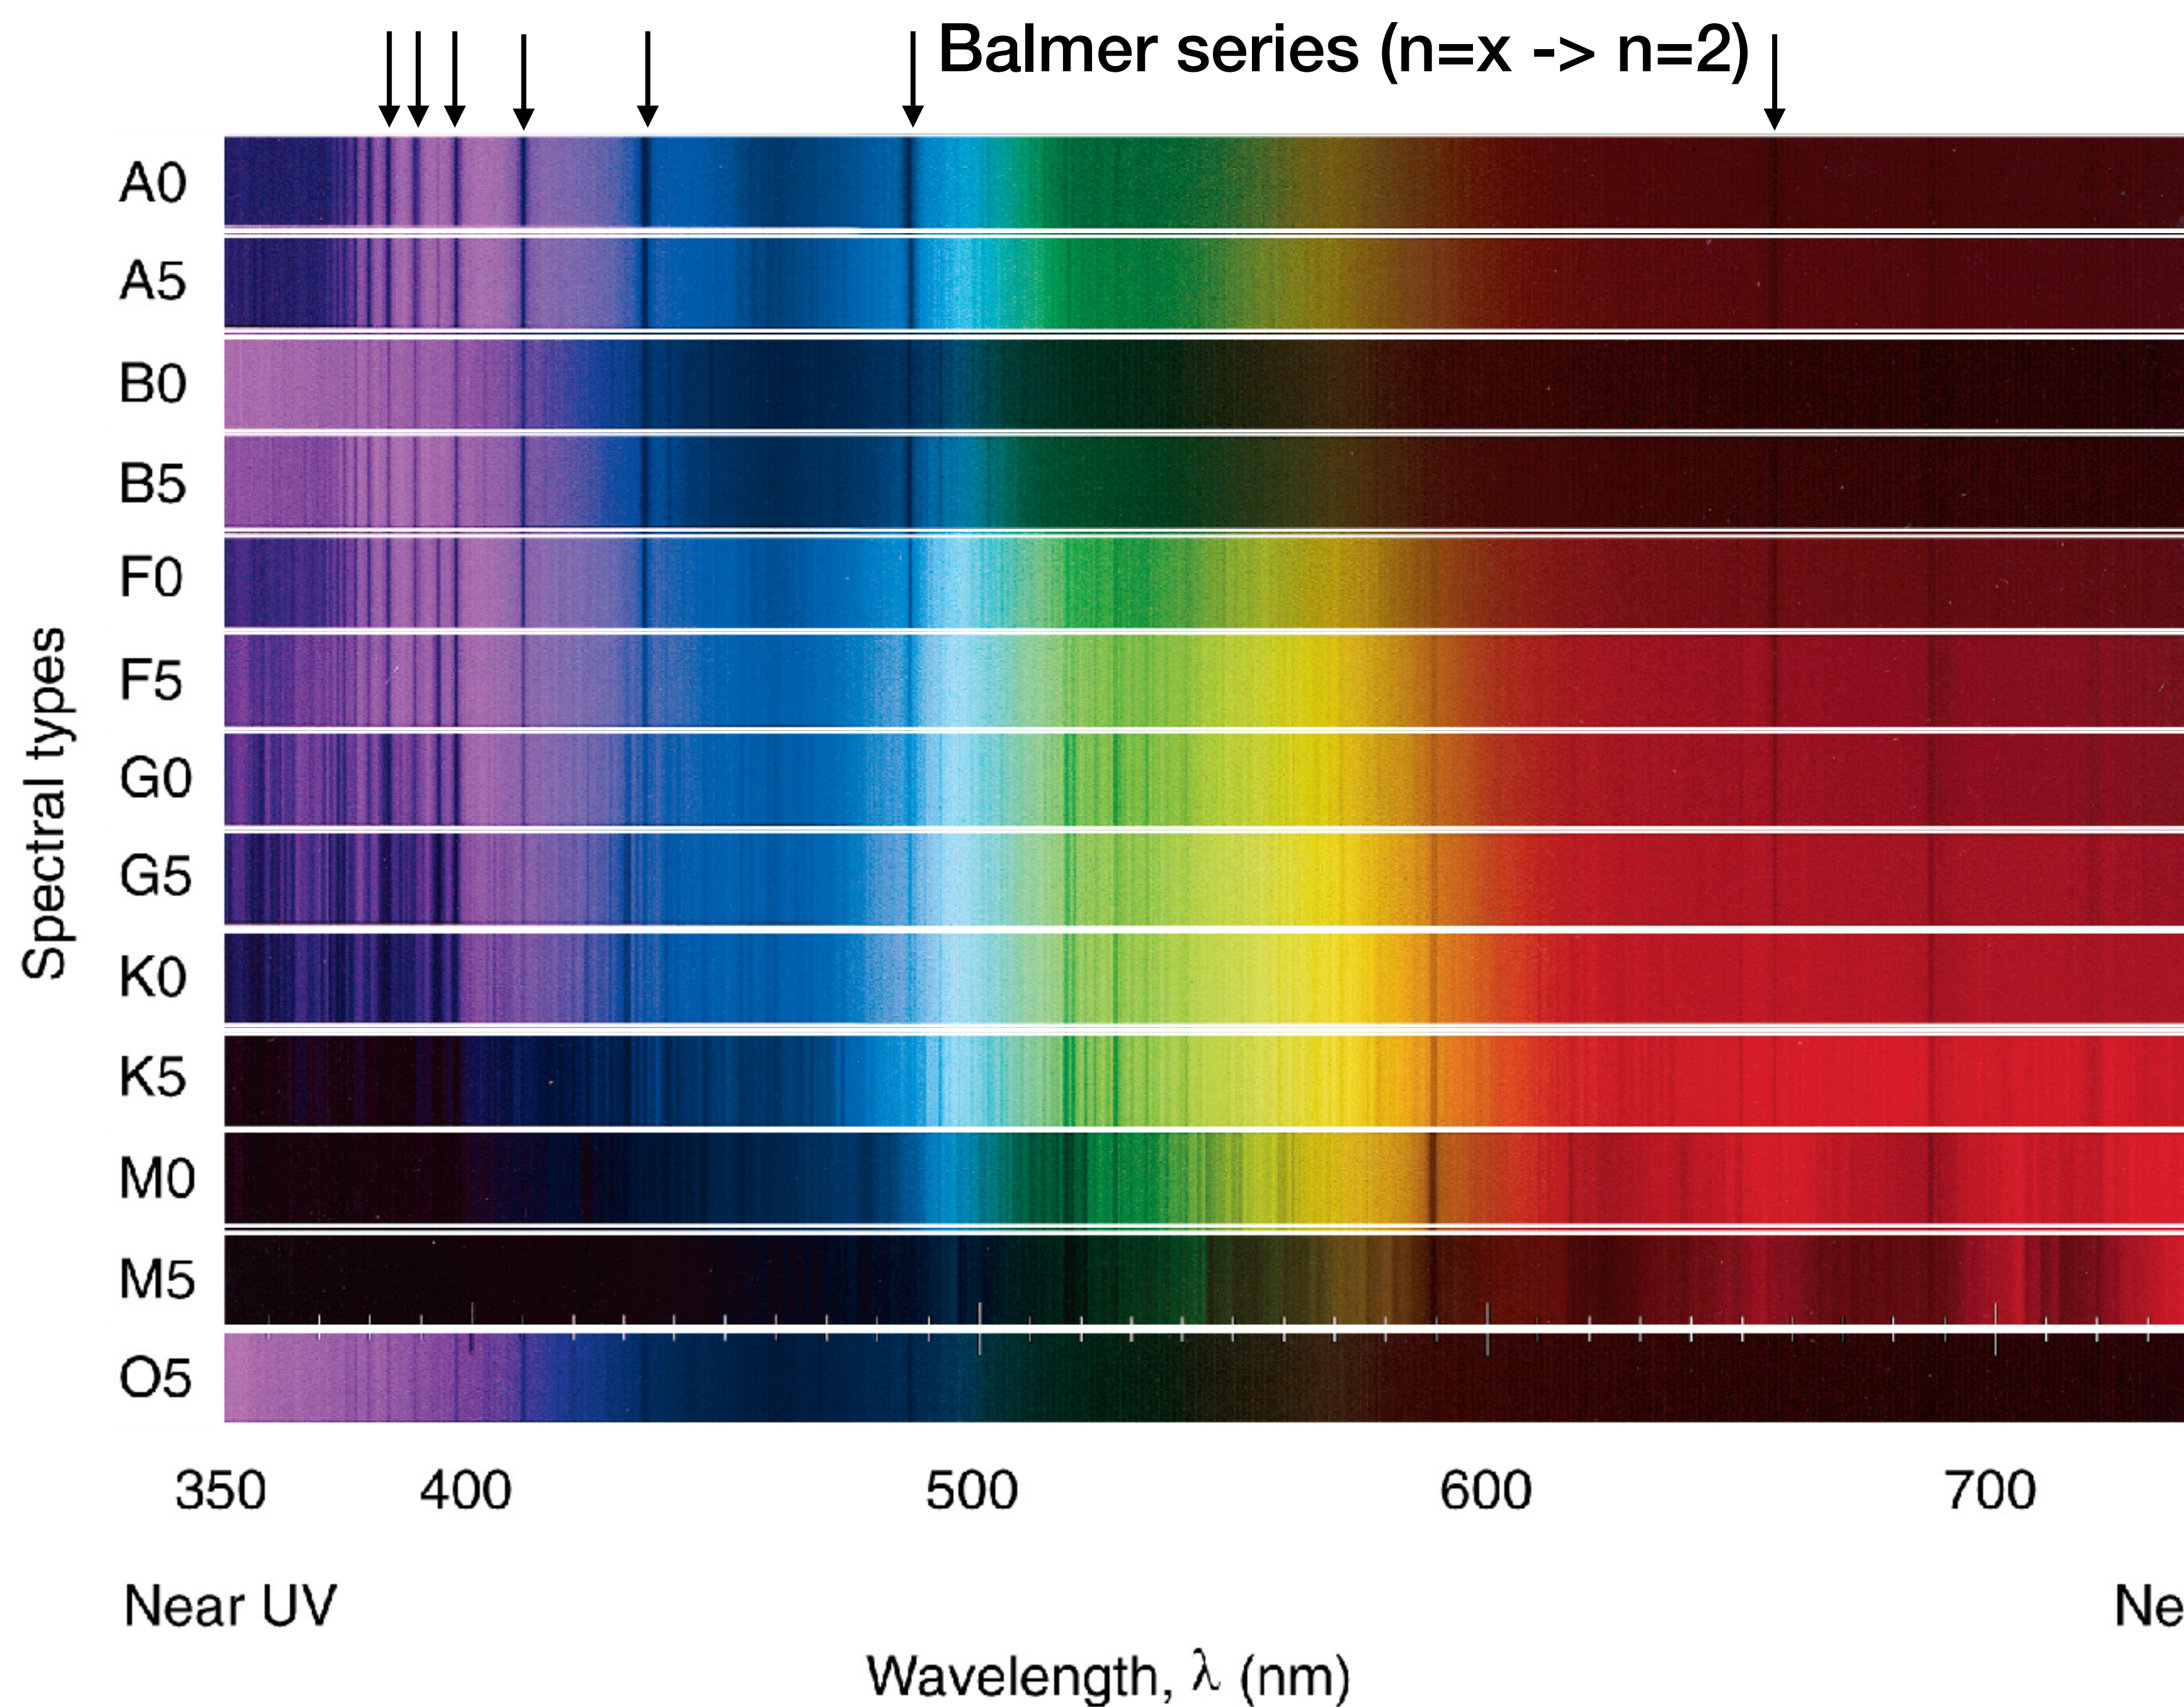

Prof Pickering did not really consider astronomy science, but the widow of Henry Draper (of the HD star catalog) donated a bunch of money.

His housekeeper, Williamina Fleming, was more competent (and cheaper) than his male assistant, so she ran the show

These female “computers” founded modern astronomy

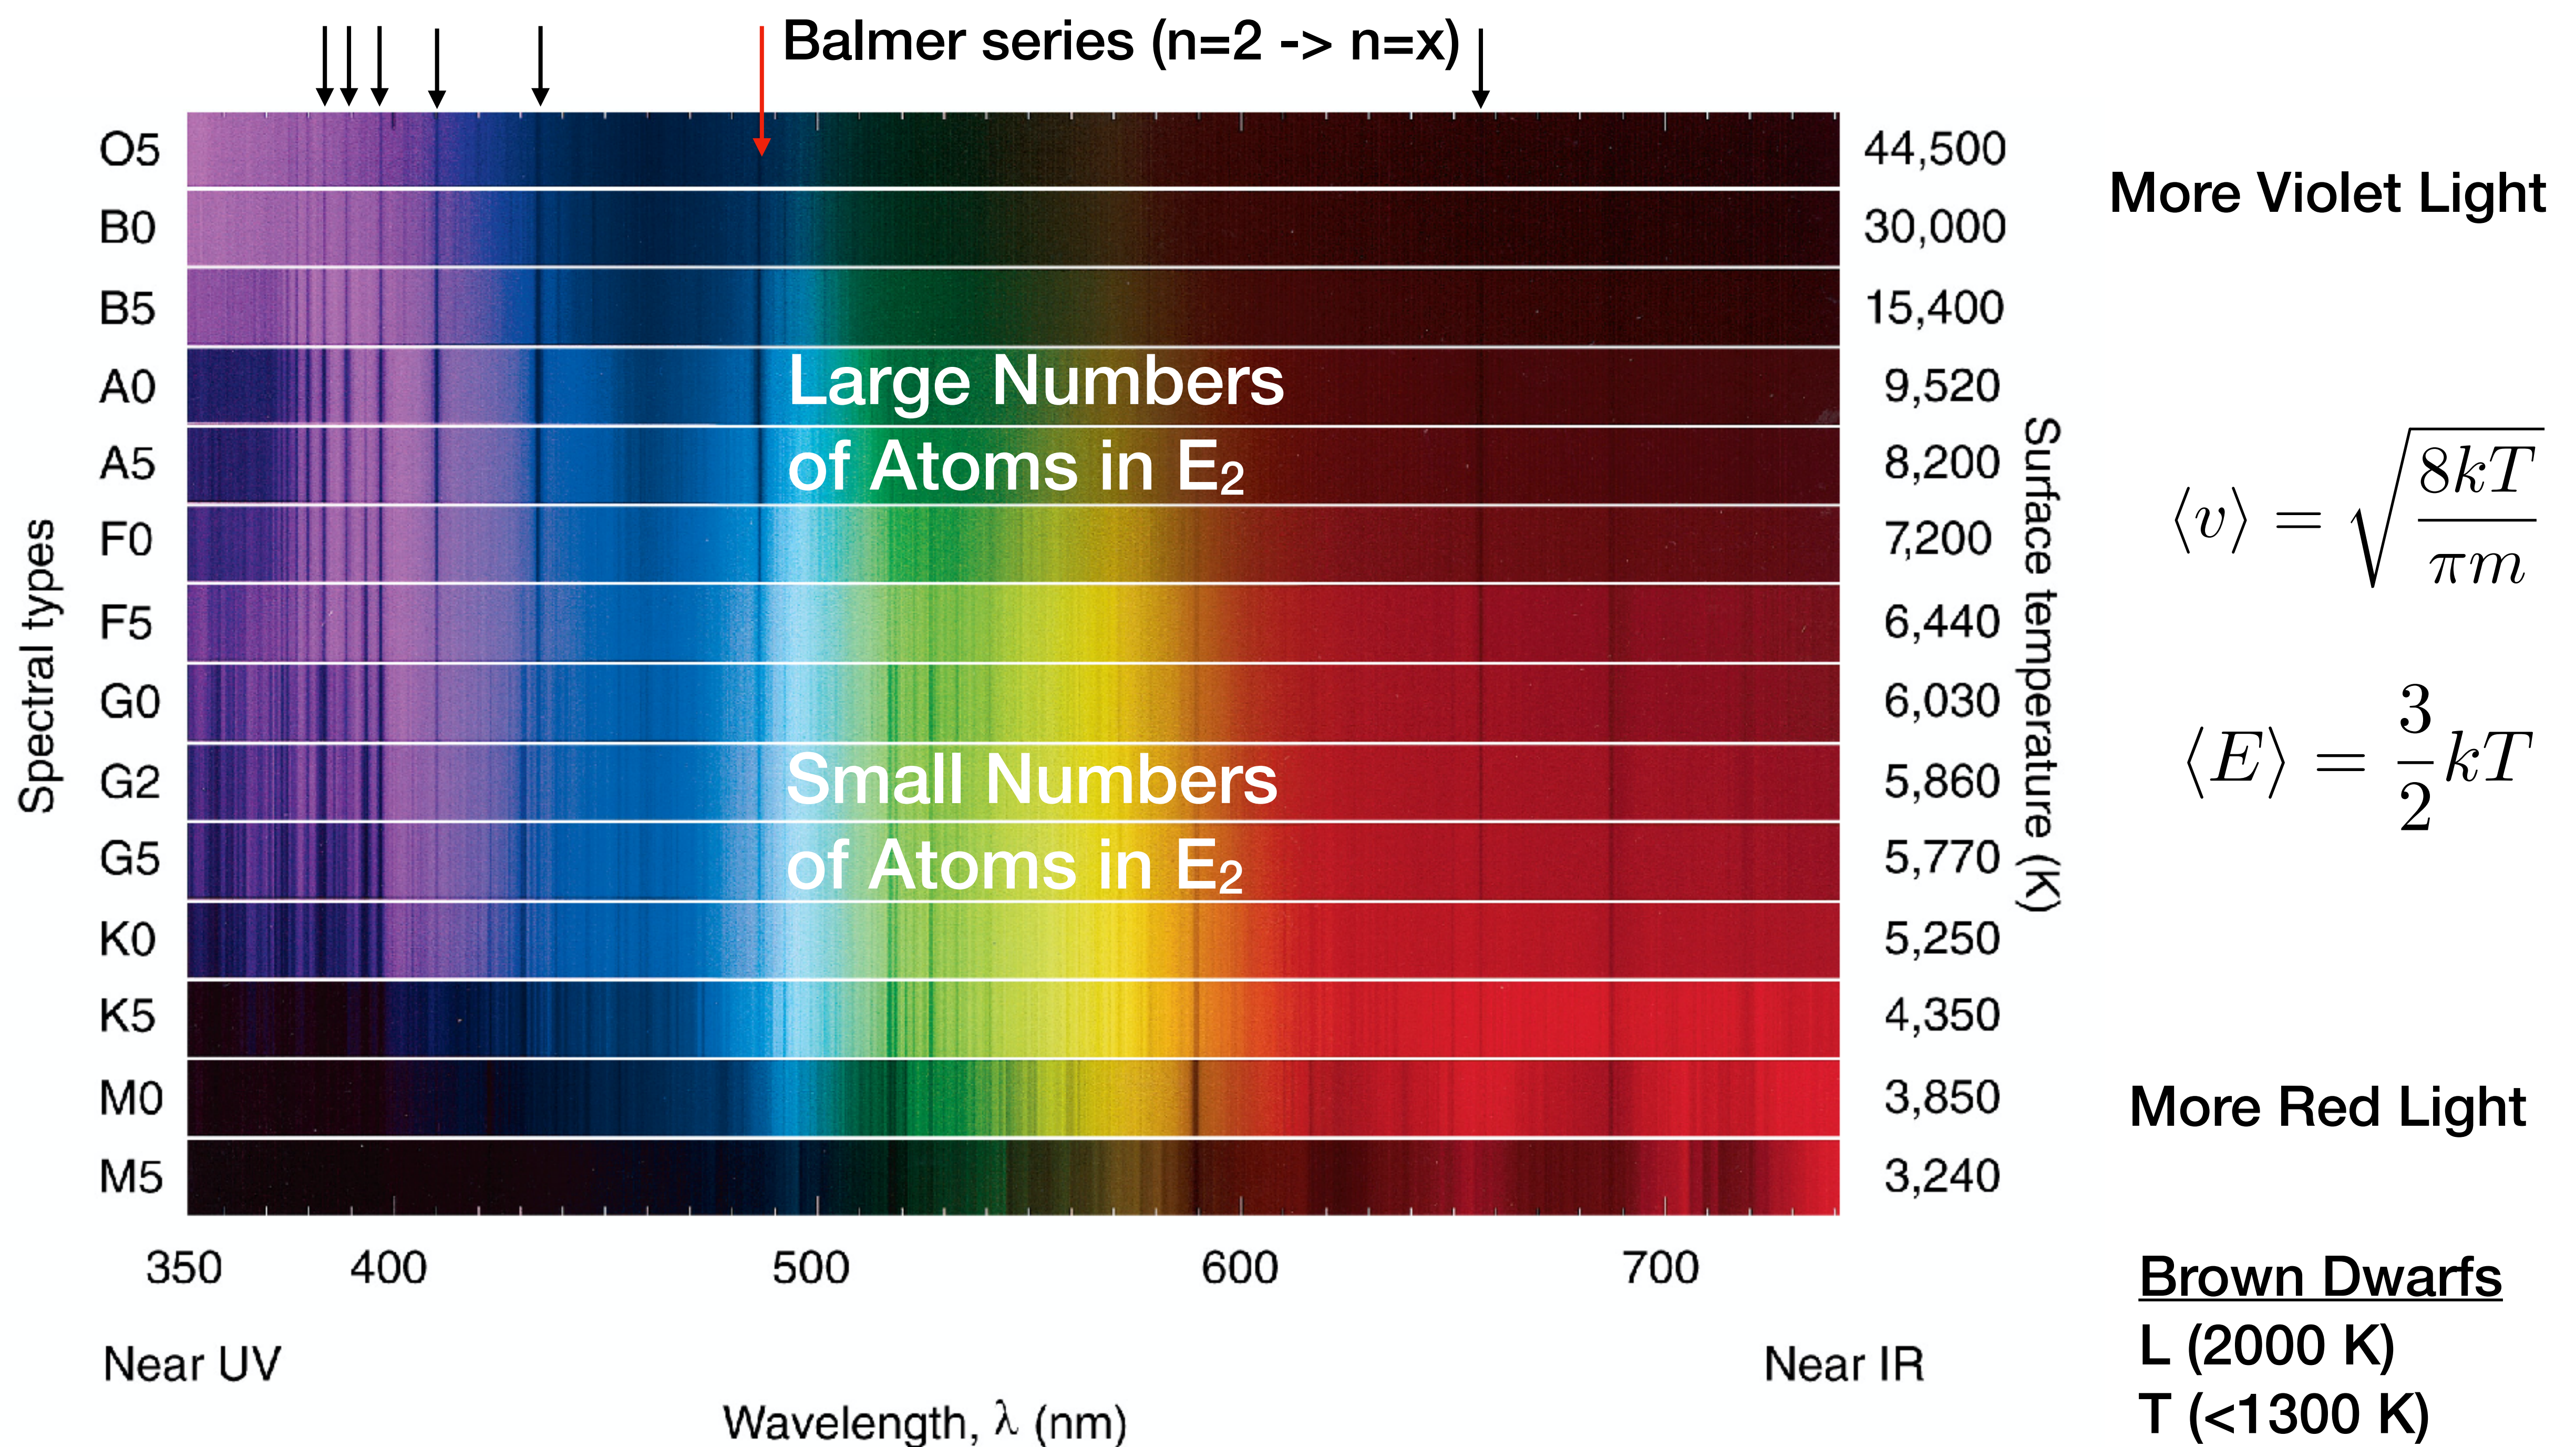

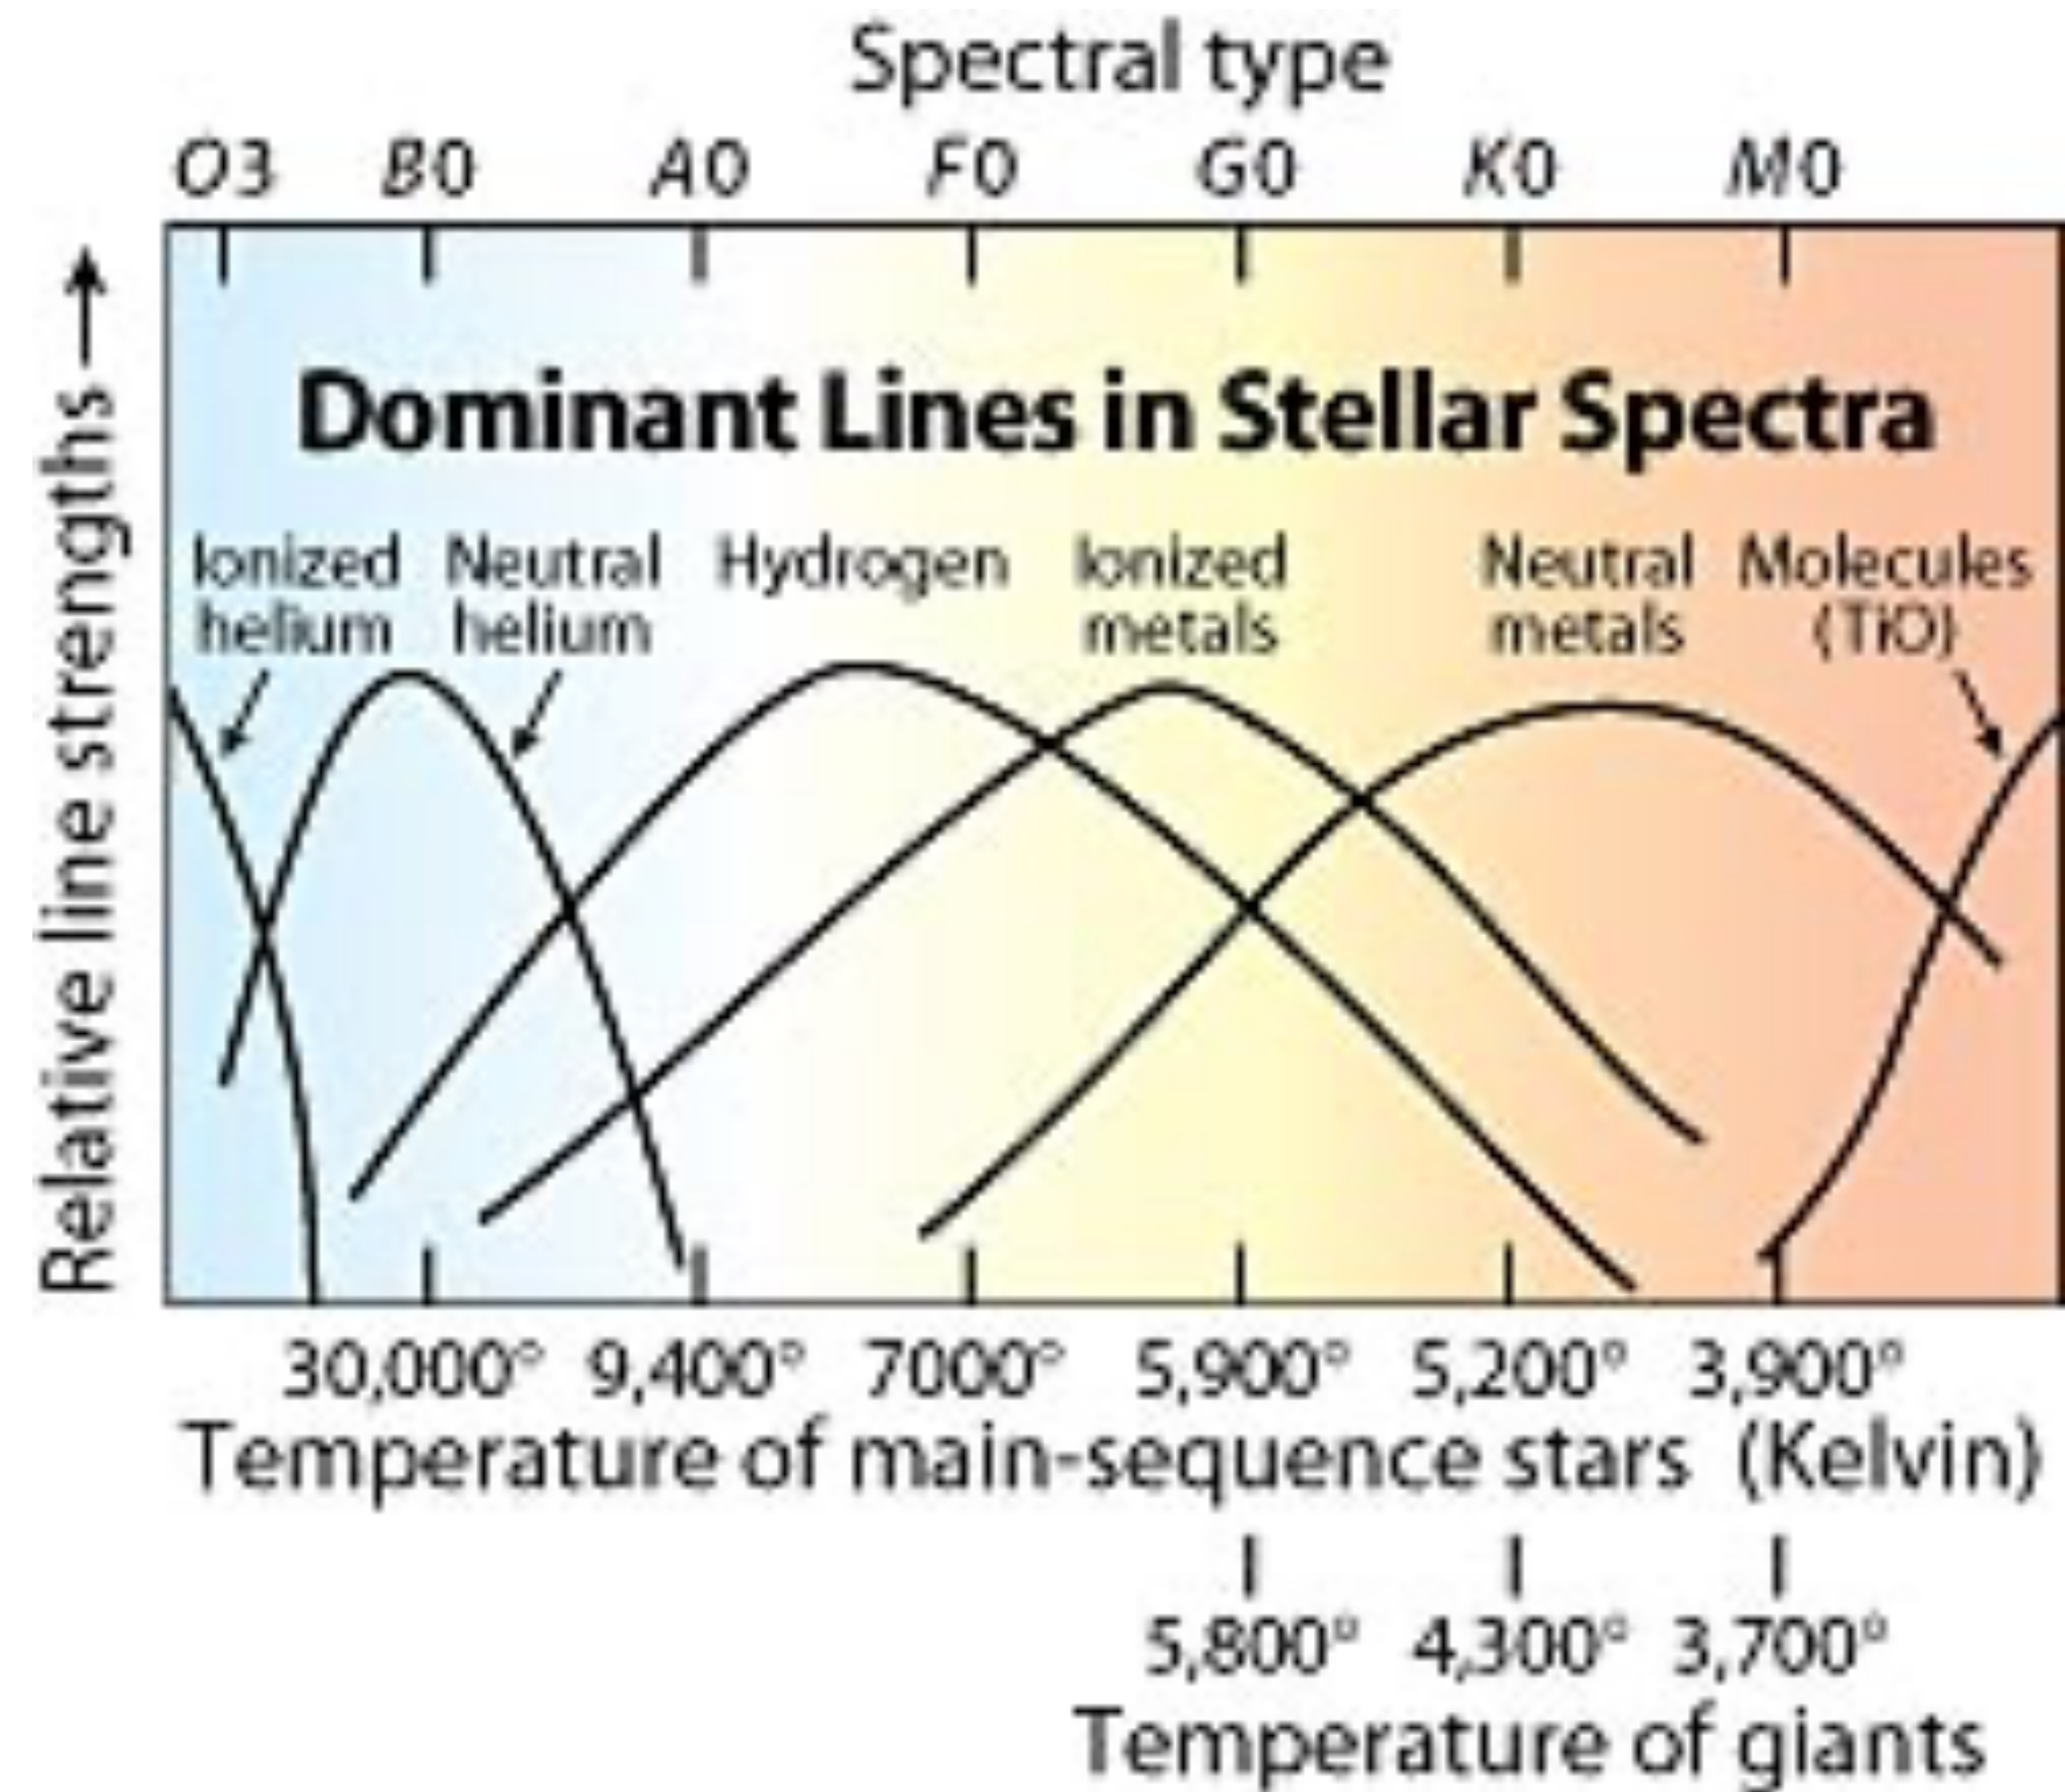

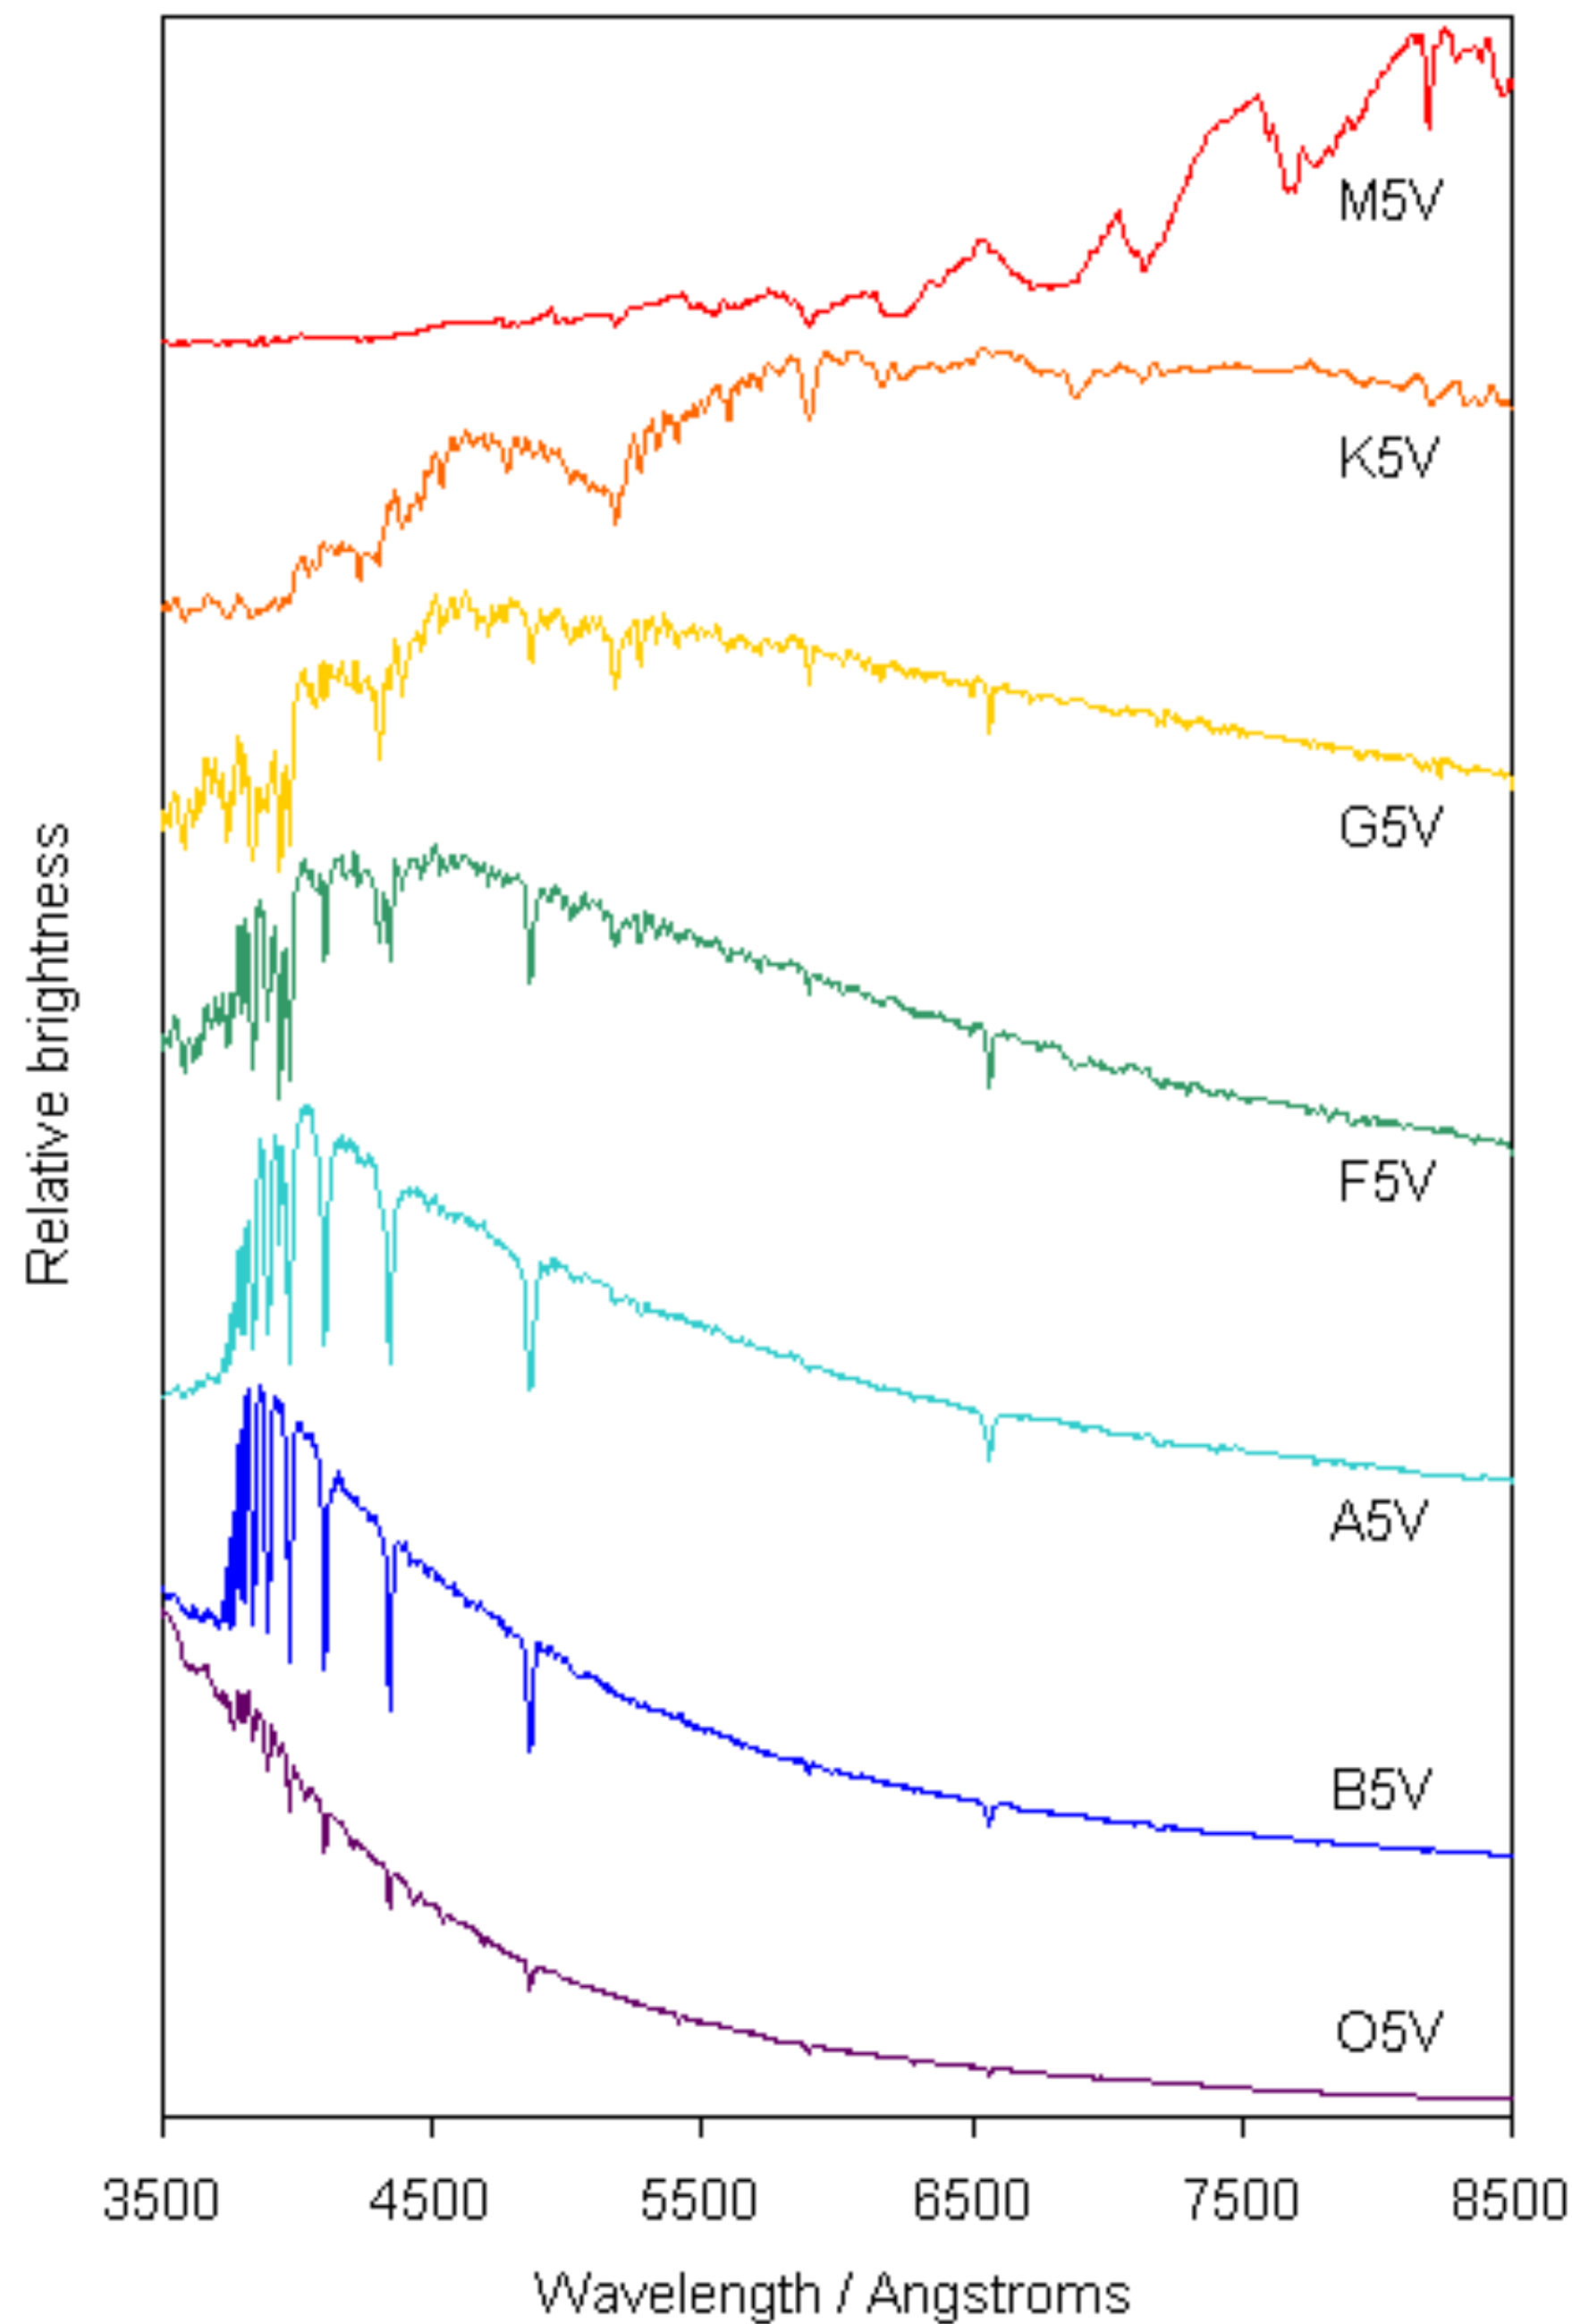

Annie Jump Cannon Classifies the Stars

- one of “Pickering’s Harem,” a Harvard “Calculator”
- part of the effort to catalog every star in the sky down to 9th magnitude
- defined the classification scheme for stellar spectra
- manually classified over 350,000 stars
- realized stellar types correlated with temperature (but not in the original order)

Line Strengths depend on Type

Spectral Classification

Temperature Sequence (color)

Luminosity Classes

Luminosity Type corresponds to Star's Size

$$L \propto R^2 T^4$$

???

I

Supergiant

II

Bright giant

III

Giant

IV

Sub giant

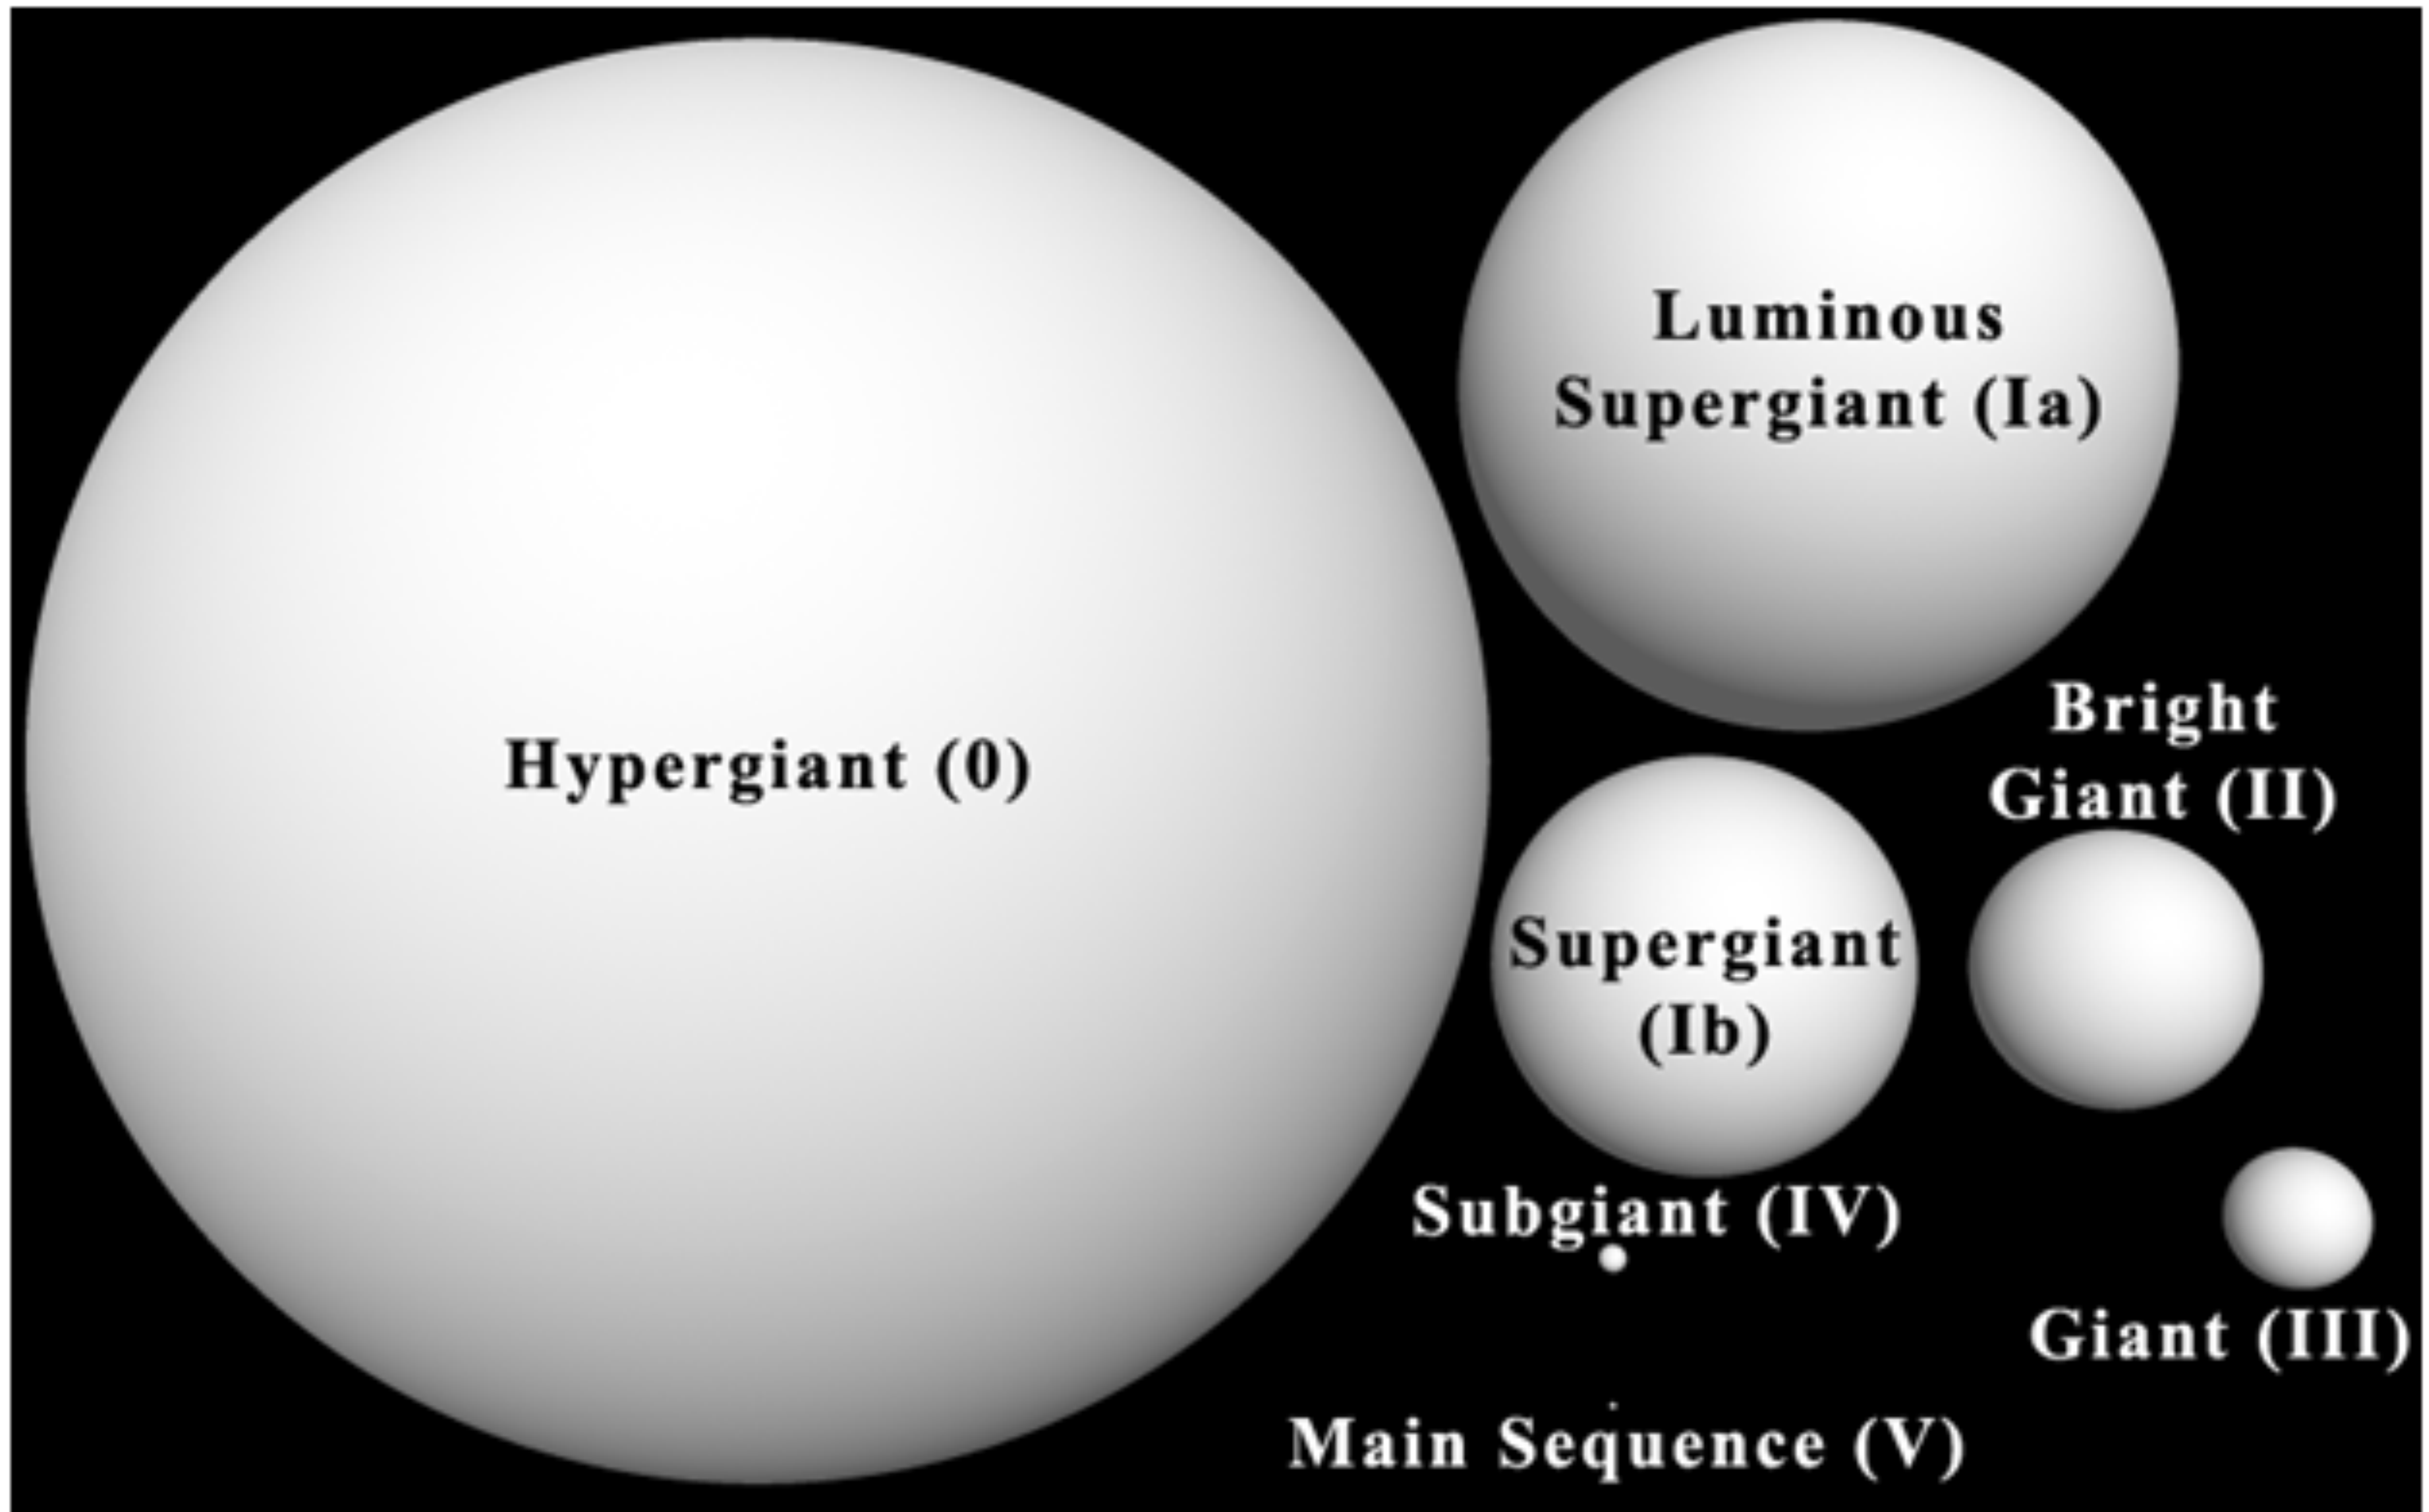

V

Dwarf (main sequence)

VI

Subdwarf

Our Sun is class G2 V

Hertzsprung-Russell Diagram (or color-magnitude diagram: CMD)

$$T_{\text{eff}} = \left(\frac{L}{4\pi R^2 \sigma_{\text{SB}}} \right)^{1/4}$$

$$L \propto R^2 T^4$$

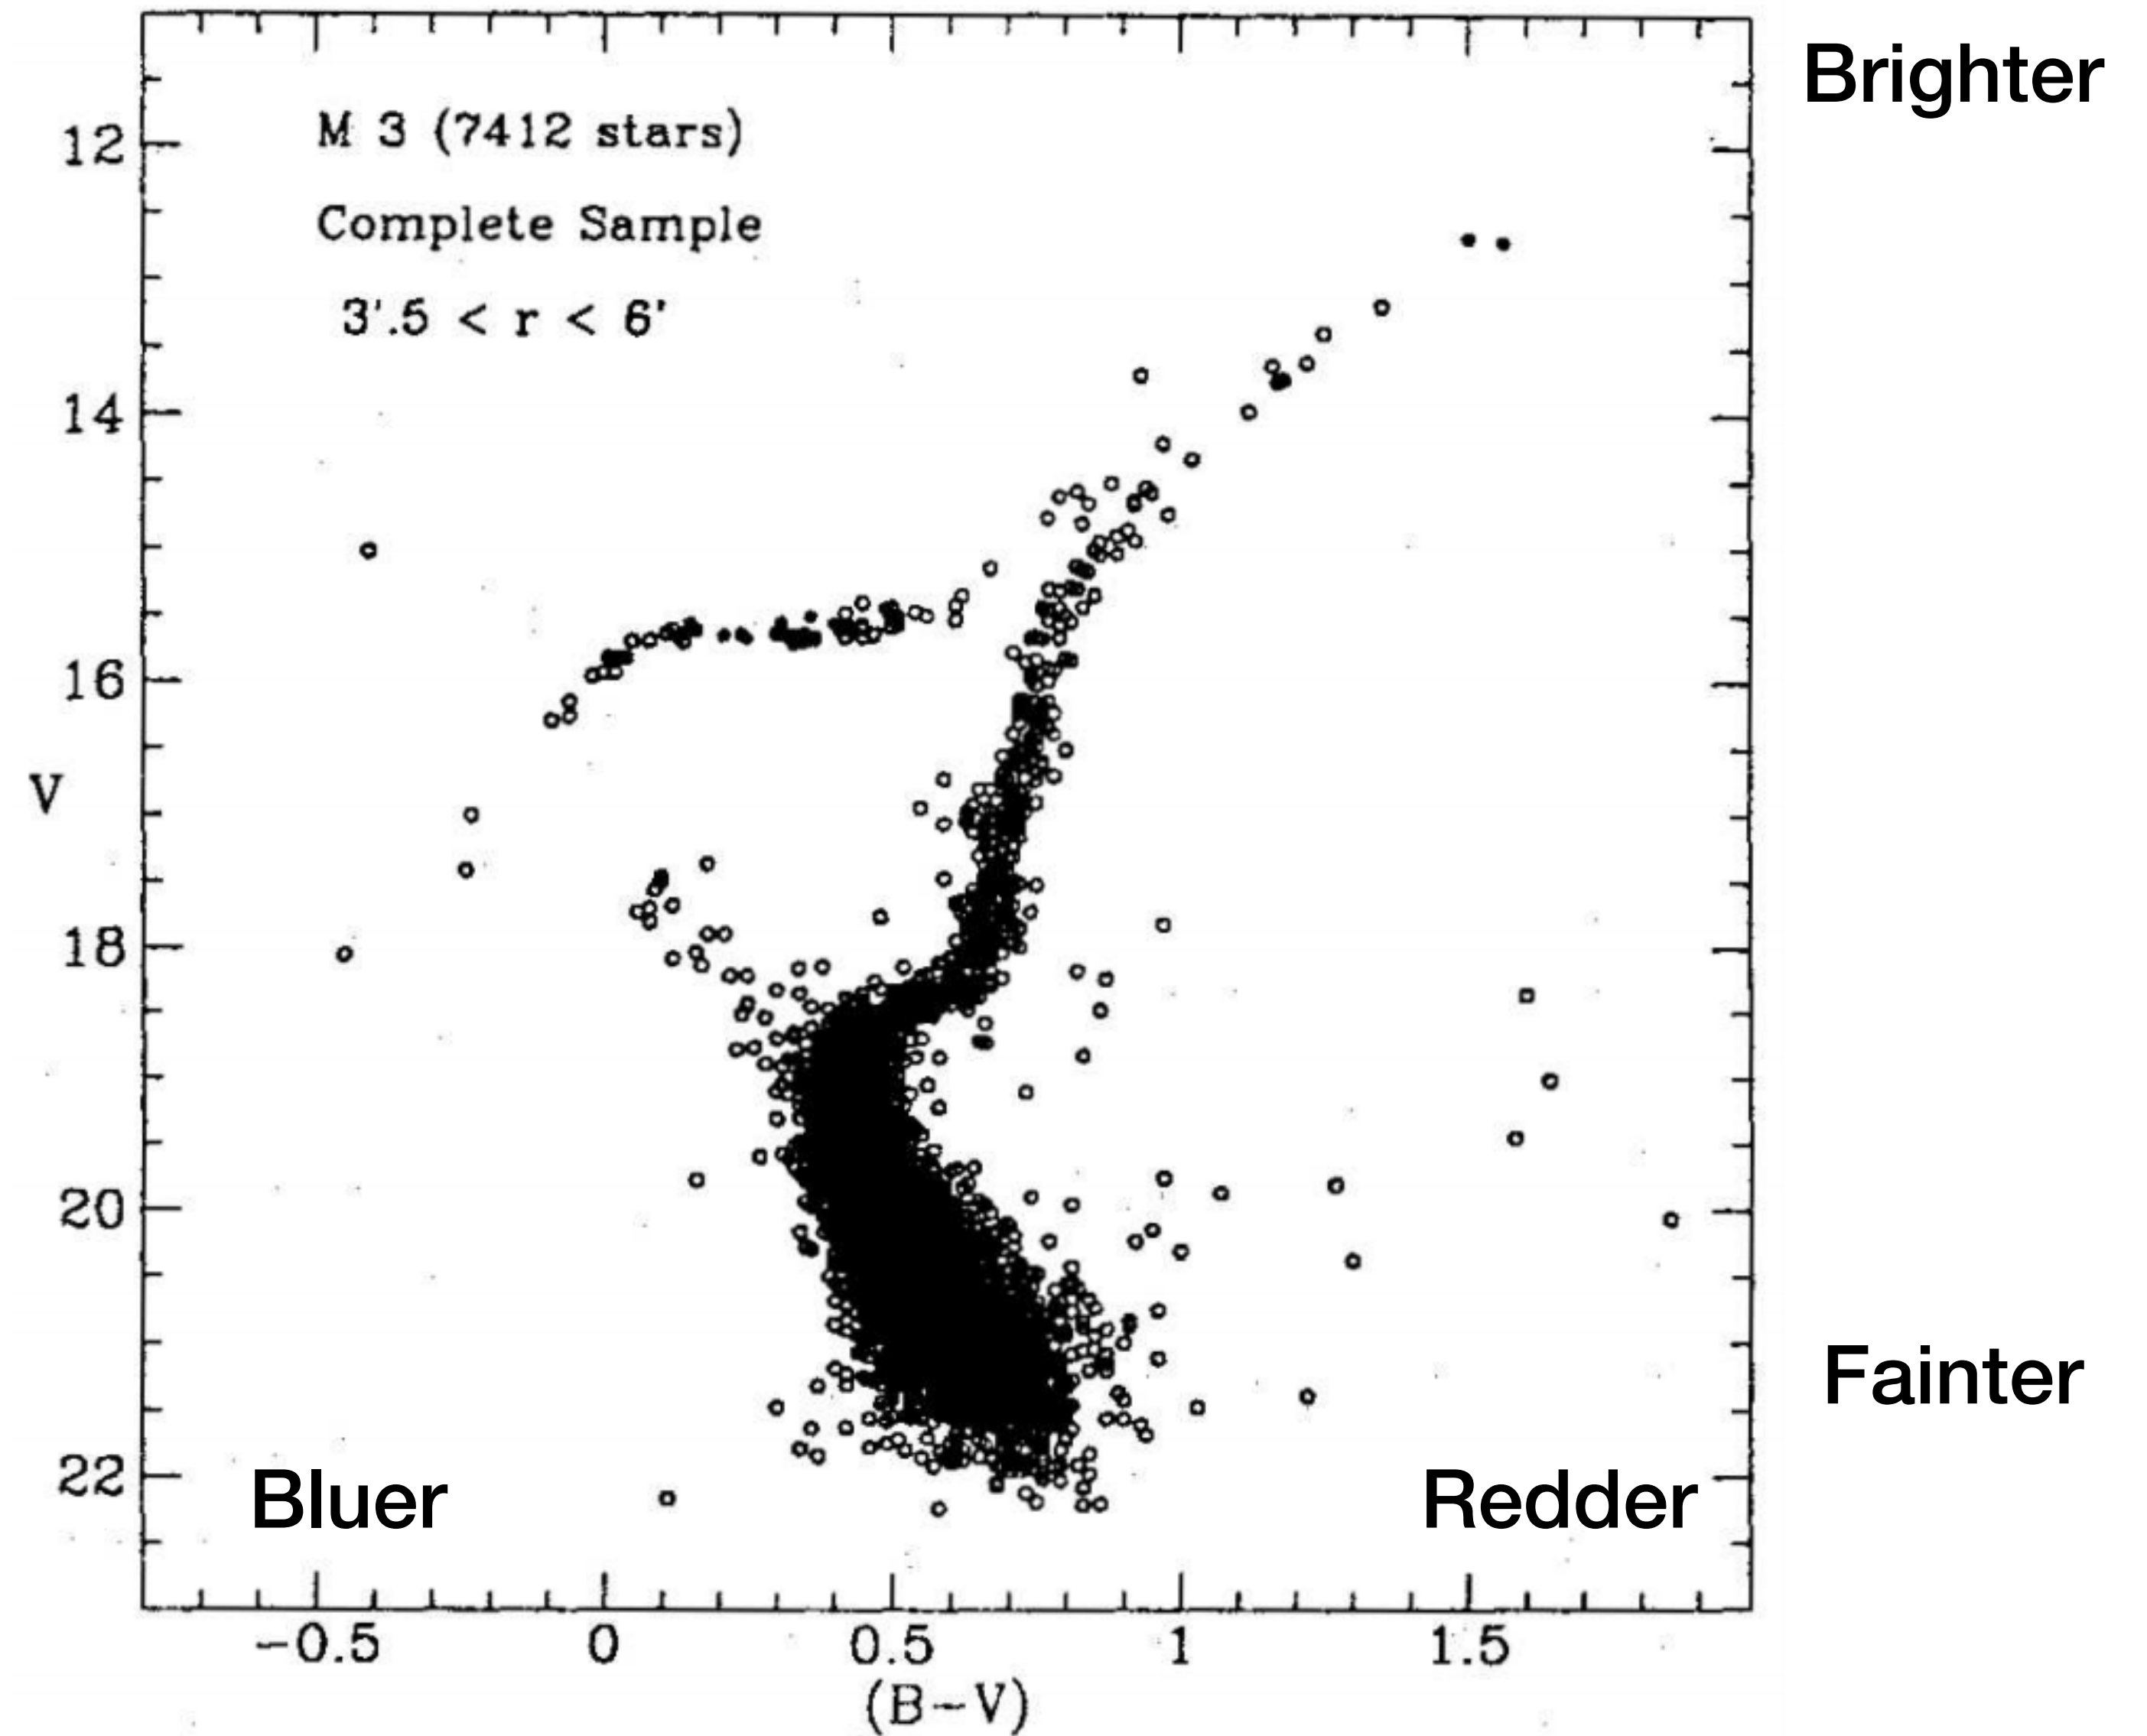

$$\log L \propto 2 \log R - 4 \log T^{-1}$$

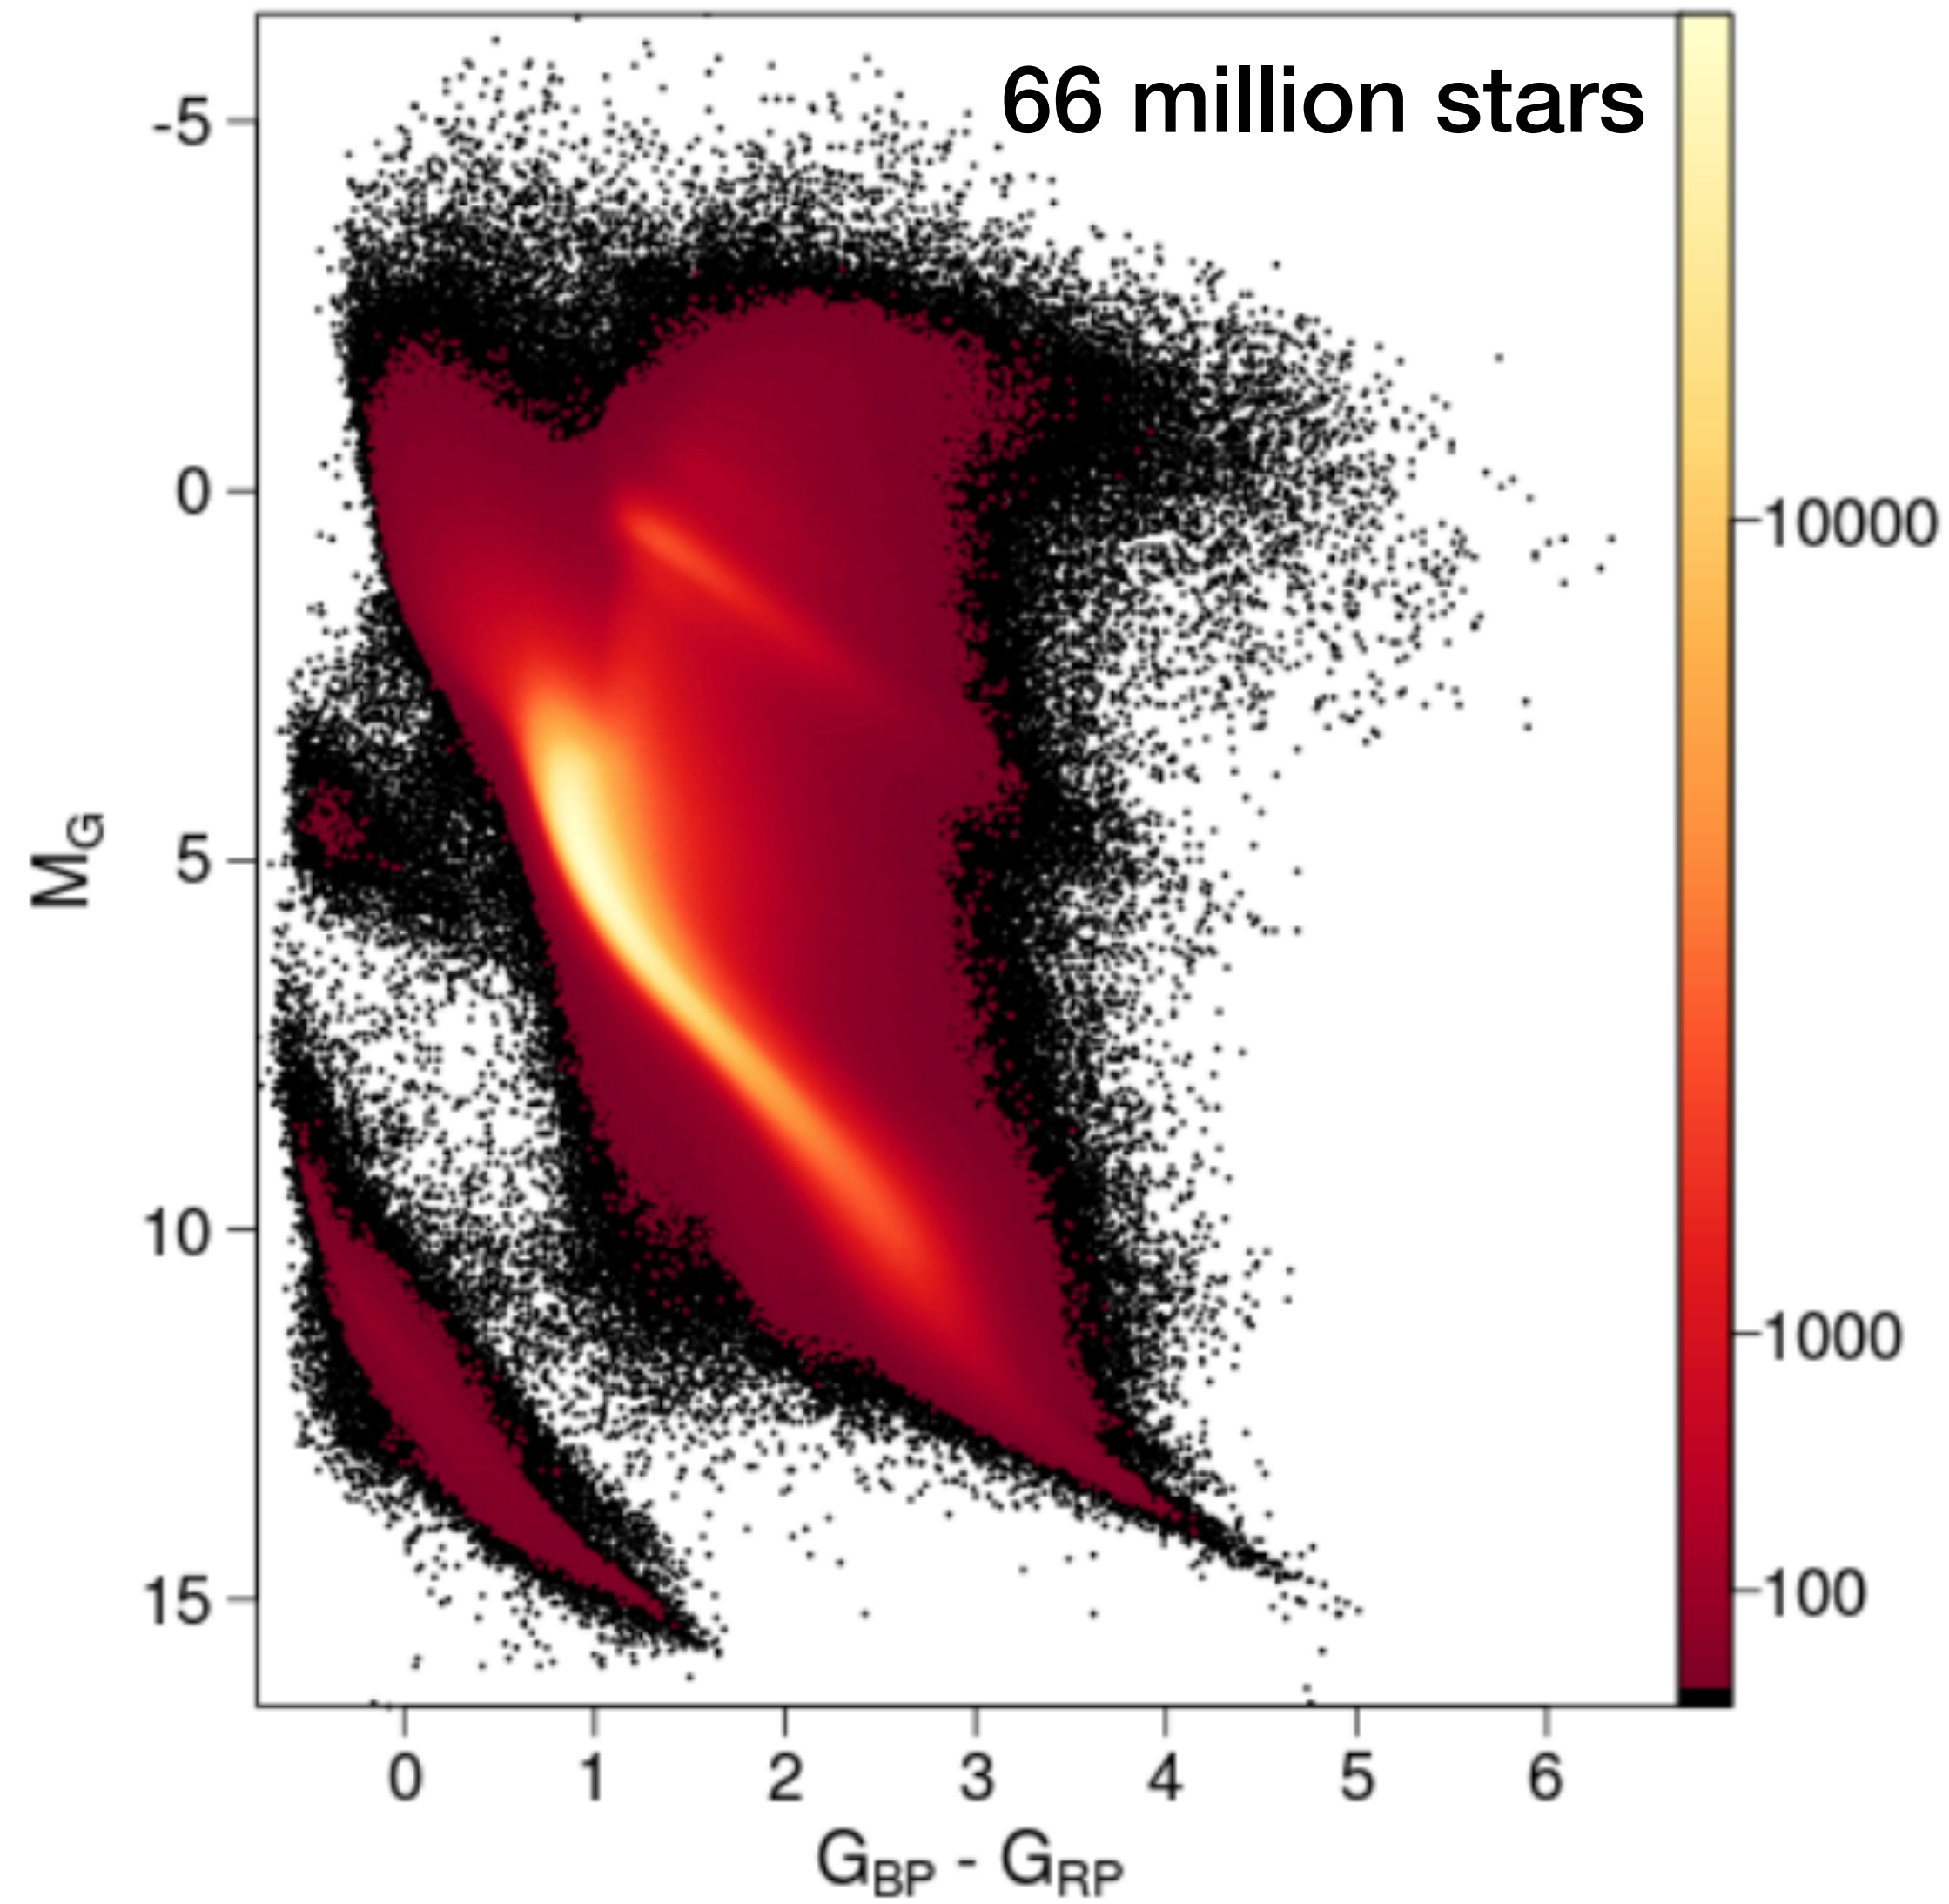

Color (B-V) - Magnitude (V) Diagram (CMD) version
