# **Cosmic Microwave Background** ASTR/PHYS 4080: Intro to Cosmology

**ASTR/PHYS 4080: Introduction to Cosmology** 

Week 8

### HW 6 due <u>on Monday</u> HW 7 due on Friday next week

Today: Dark Matter (finish Ch. 7) CMB (start Ch. 8)

2.7255 K

# **Brief History**

- 1934 (Richard Tolman) blackbody radiation in an expanding universe cools but retains its thermal distribution and remains a blackbody
- temperature of space of ~2.3K
- early universe (high expansion rate, assume matter dominates)
- 1948 (Gamow) T~10<sup>9</sup> K when deuterium formed, argues for radiation domination in early universe; the existence of CMB
- 1948 (Alpher, Bethe, & Gamow [αβγ paper]), element synthesis in an expanding universe; calculations based on previous ideas
- dominated initial state); no mention of the observability. **ASTR/PHYS 4080: Introduction to Cosmology**

• 1941 (Andrew McKellar) excitation of interstellar CN doublet absorption lines gives an effective

• 1946 (Gamow) to match observed abundance, nuclei should be built up out of equilibrium in hot

1948 (Alpher & Herman) make corrections to previous results; state that present radiation temperature should be ~5K (close! but largely a coincidence; incorrect assumptions - neutron

## **Brief History**

- 1957 (Shmaonov) horn antenna at 3.2cm, find the absolute effective temperature of radio emission background 4±3K, independent of time and direction
- Early 1960s, (Zel'dovich, Doroshkevich, Novikov) estimate expected background temperature from helium abundance; realize Bell Labs telescope can constrain
- 1964 (Hoyle & Tayler) essentially correct version of primordial helium abundance calculation (no longer pure neutron initial state; weak interaction for neutron vs proton)
- 1965 (Dicke, Peebles, Roll, & Wilkinson) realize oscillating or singular universe might have thermal background; build detector to search; then they hear about its discovery
- 1965 (Penzias & Wilson) antenna has isotropic noise of 3.5±1.0K at wavelength of 7.35cm; careful experiment (e.g., shooed away pigeons roosted in the antenna; cleaned up "the usual white dielectric" generated by pigeons); explanation could be that of Dicke et al.

**ASTR/PHYS 4080: Introduction to Cosmology** 

## **Brief History**

- with Penzias & Wilson for blackbody spectrum; isotropic to 10%
- 1966-1967 (Field & Hitchcock, Shklovsky, Thaddeus & Clauser, Thaddeus [following a CMB (McKellar's 1941 observation explained!)
- 1970s-1980s, ground, balloon, satellite observations
- isotropic blackbody and discovers the anisotropies.
- then the launches of WMAP (2001) and Planck (2009)

**ASTR/PHYS 4080: Introduction to Cosmology** 

• 1965 (Roll & Wilkinson) detect the radiation background at 3.2cm, with amplitude consistent

suggestion by Woolf]) independently show that the excitation of interstellar CN is caused by

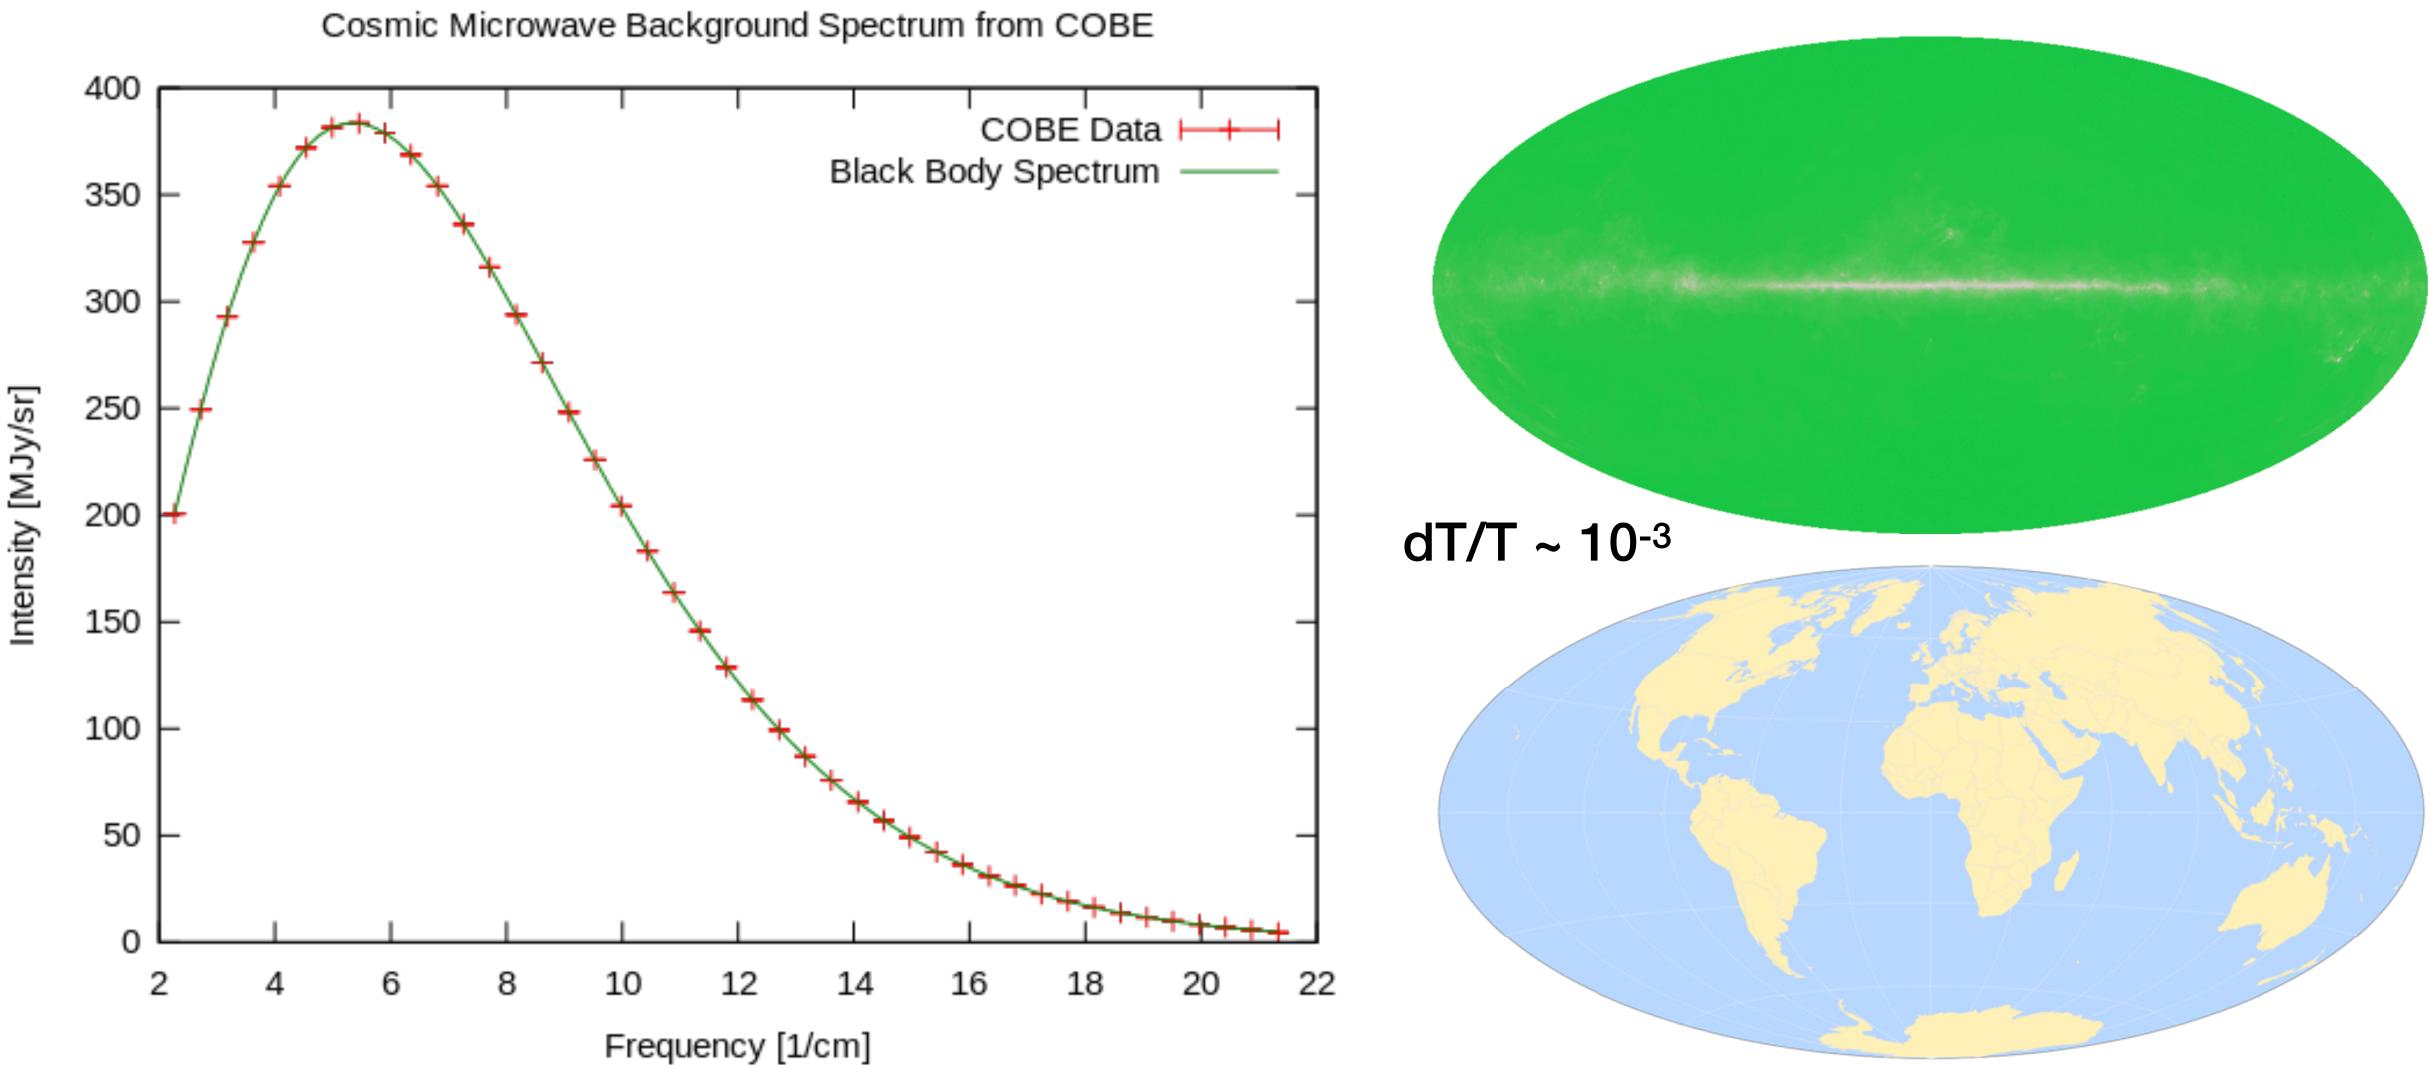

• 1992, NASA's COsmic Background Explorer (COBE) satellite confirms CMB as nearly perfect

• Era of "precision cosmology" begins, especially with SNe measurements a few years later and

## Near perfect BB everywhere on the sky

**ASTR/PHYS 4080: Introduction to Cosmology** 

## Spatial variations on different scales

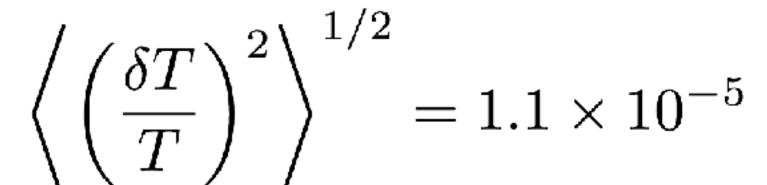

dT ~ 3.353 mK

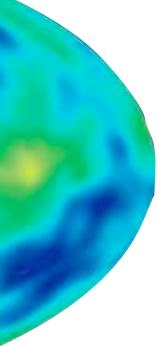

**ASTR/PHYS 4080: Introduction to Cosmology** 

 $\frac{\delta T}{T}(\theta,\phi) \equiv \frac{T(\theta,\phi) - \langle T \rangle}{T}$ 

dT ~ 0.018 mK

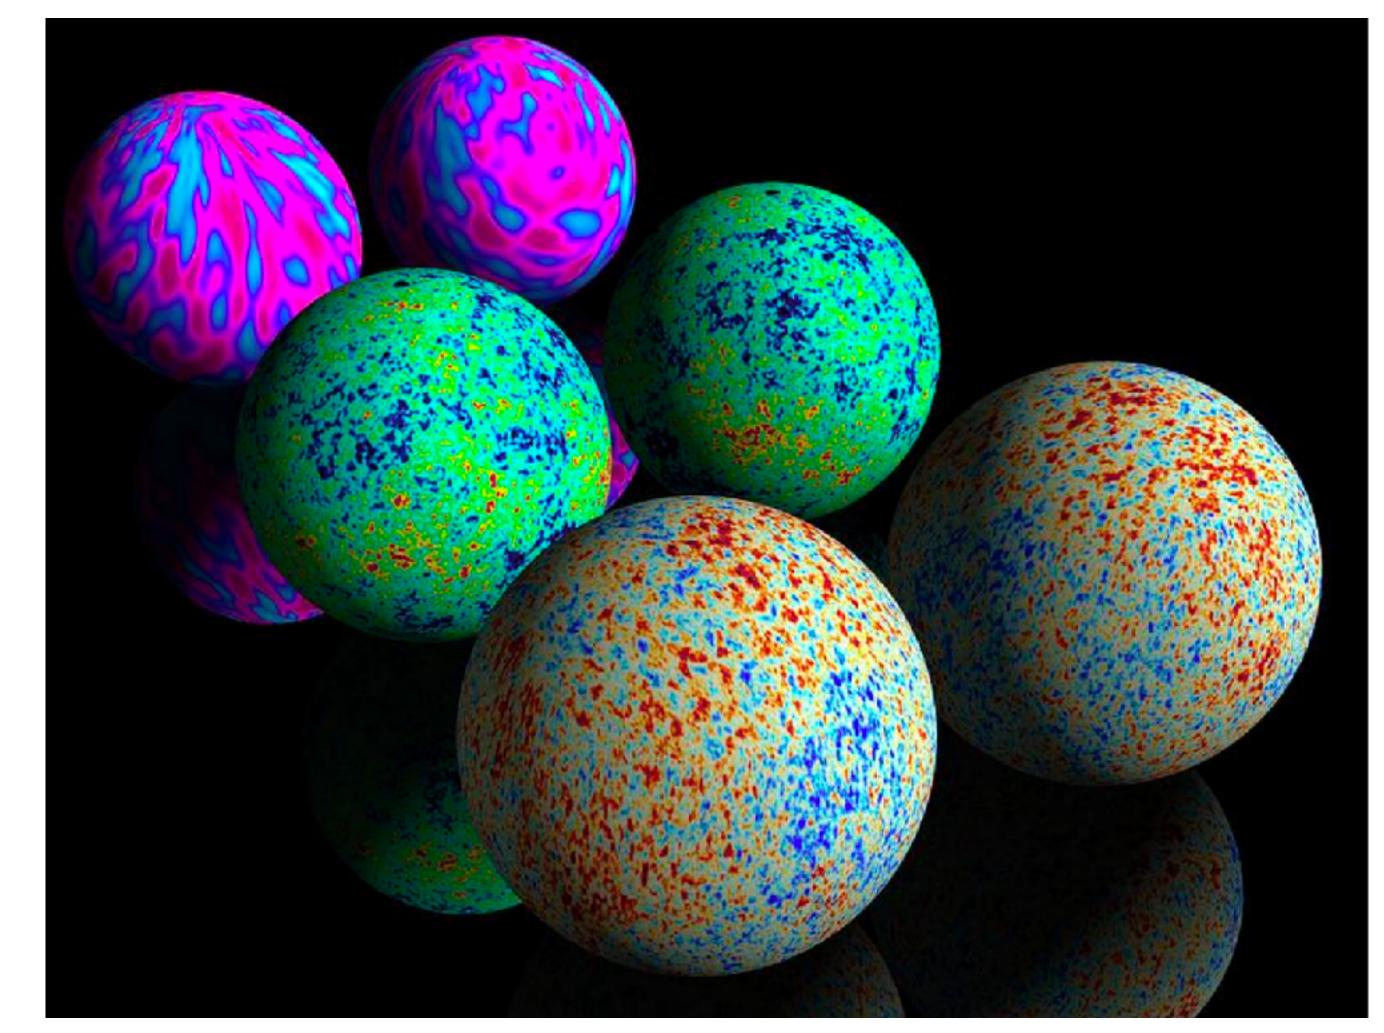

## History of CMB space measurements

COBE 1990

WMAP 2003

Planck 2013

**ASTR/PHYS 4080: Introduction to Cosmology** 

## Primary aim to measure small-scale fluctuations

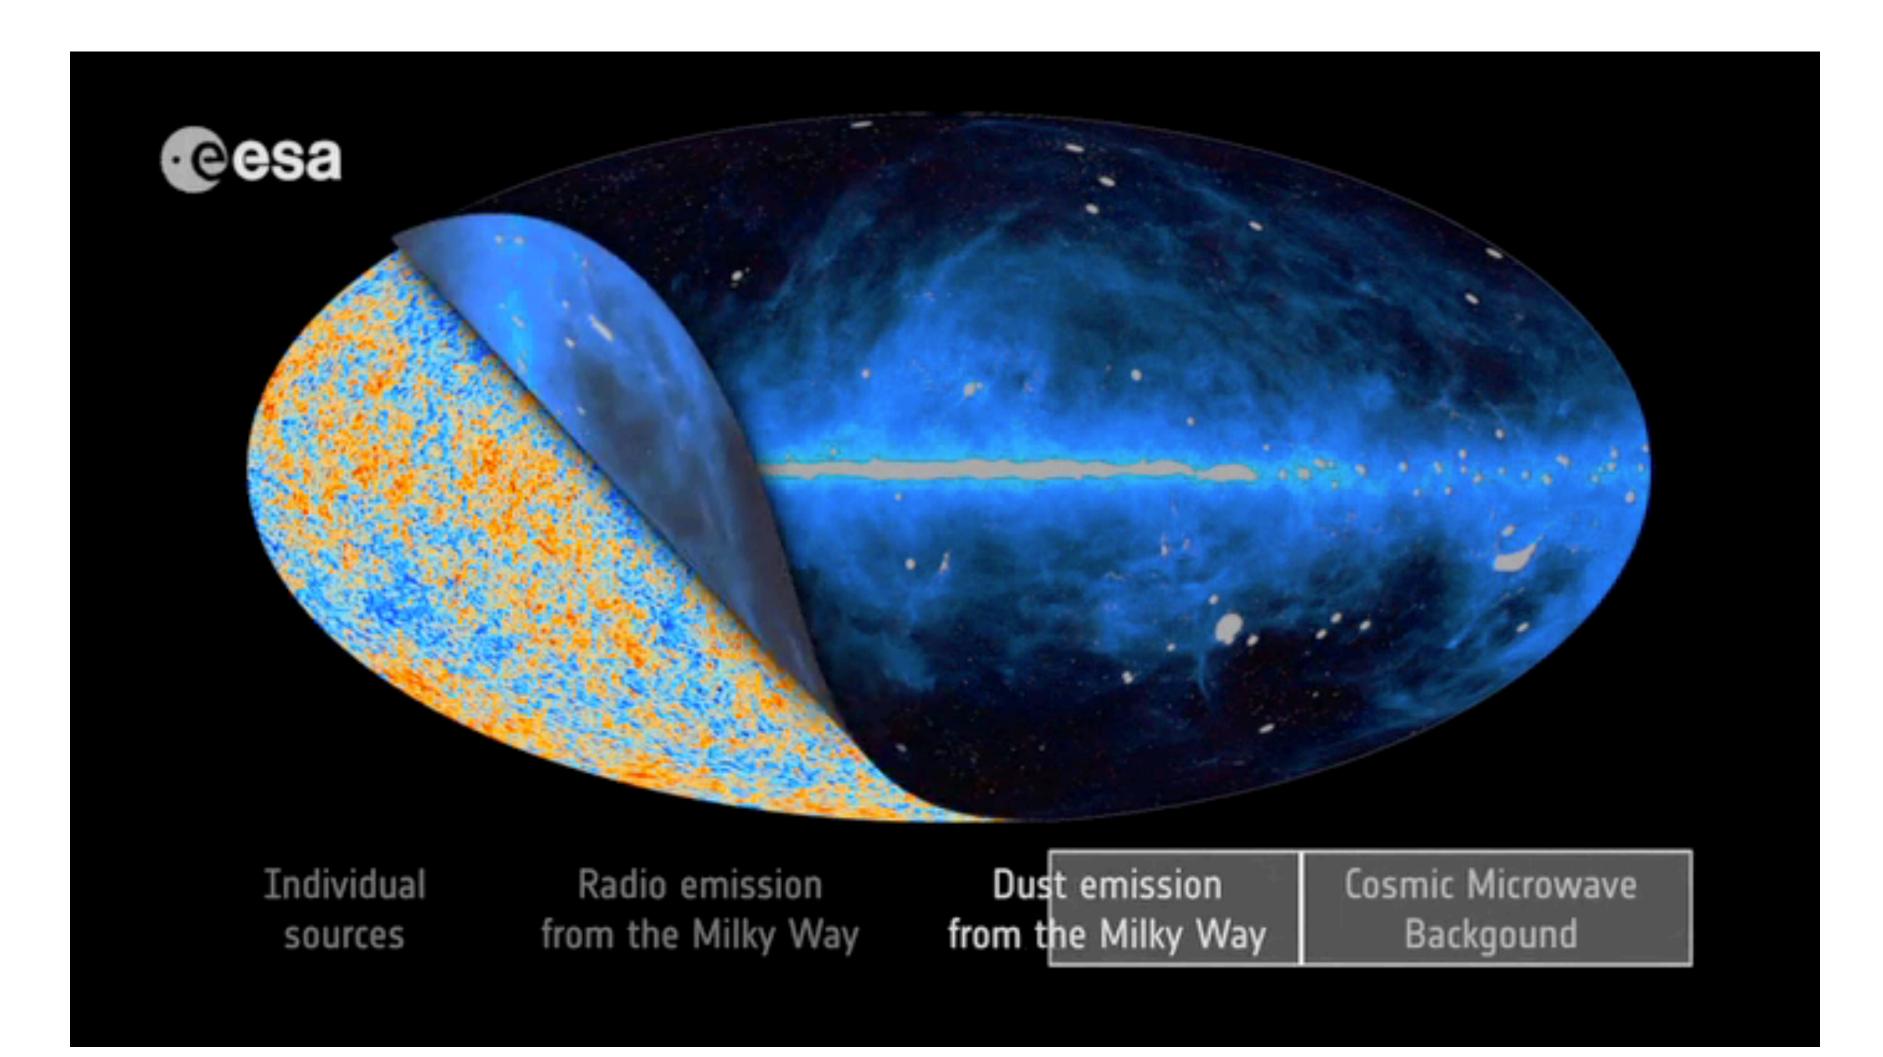

**ASTR/PHYS 4080: Introduction to Cosmology** 

## **Observing the CMB**

**ASTR/PHYS 4080: Introduction to Cosmology** 

## What produces the CMB and features we see?

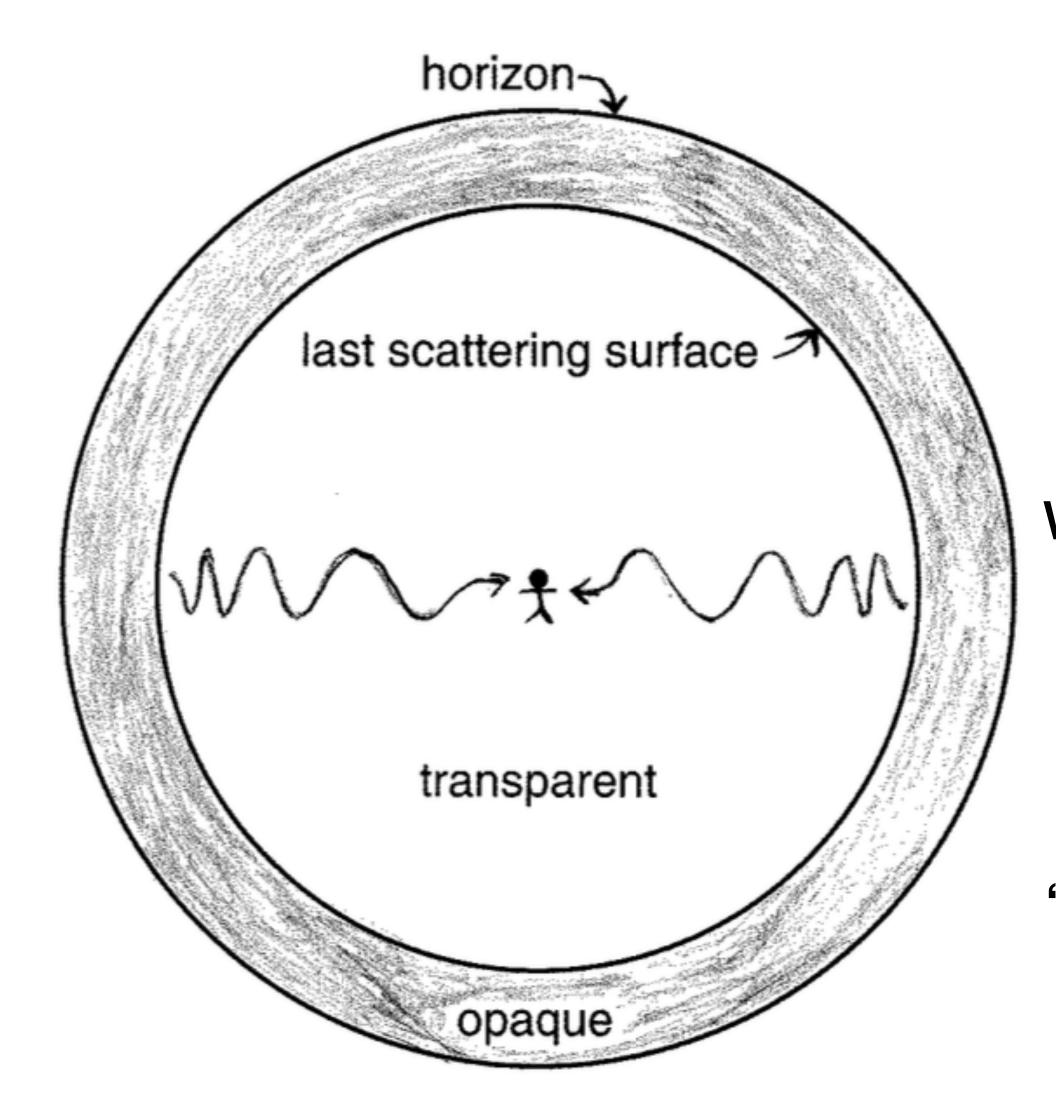

- In the early universe, many interactions between particles (just like at the LHC) quarks, electrons, photons, neutrinos all transform into each other
- As universe expands, densities decrease and protons/electrons/photons dominate baryon soup
  - Eventually, electrons can be captured by protons to form atoms that are not immediately broken up by energetic photons -> recombination
  - Soon thereafter, the density of free electrons is too low to scatter photons, and the universe becomes transparent -> photon decoupling
- As the universe expands further, a time comes when a CMB photon scatters off an electron for one last time -> last scattering
- **ASTR/PHYS 4080: Introduction to Cosmology**

## Surface of Last Scattering

Thomson cross-section ("size" of an electron)  $\sigma_{\rho} = 6.65 \times 10^{-29} \text{ m}^2$ 

### mean free path of a photon ∧<sub>mfp</sub> $n_{\rho}\sigma_{\rho}$

### **ASTR/PHYS 4080: Introduction to Cosmology**

Scattering interaction rate

$$\Gamma = \frac{c}{\lambda} = n_e \sigma_e c$$

When photons scatter off of electrons at the same rate as the expansion rate:

$$H(z) = \Gamma(z)$$

Photons and baryons will "decouple" from each other

11

## Recombination

## $\langle h\nu \rangle < H_{\rm ionize} = Q = 13.6 \text{ eV}$ $\langle h\nu \rangle = 2.7kT \text{ (BB spectrum)}$

**ASTR/PHYS 4080: Introduction to Cosmology** 

### $H + \gamma \rightleftharpoons p + e^{-}$

### Implies $T \sim 60,000 \text{ K} \rightarrow \text{much too high: BB}$ spectrum has a tail

**Spring 2021: Week 08** 

12

# density of particles of  
type x with momenta b/t  

$$p \rightarrow p + dp$$
 $n_x(p)dp = g_x \frac{4\pi}{\hbar^3} \frac{p^2 dp}{\exp([E - \mu_x]/kT) \pm 1}$  (minus for bosons,  
 $g \rightarrow 2$  (for non-nucleons,  $g_{H=4}$ )  
 $chemical potential of photons = 0$   
 $\mu_H = \mu_p + \mu_e$ 
 $n_\gamma = \frac{2.4041}{\pi^2} \left(\frac{kT}{\hbar c}\right)^3$ 
 $n_x = g_x \left(\frac{m_x kT}{2\pi\hbar^2}\right)^{3/2} \exp\left(\frac{-m_x c^2 + \mu_x}{kT}\right)^{3/2}$ 
 $n_x = g_x \left(\frac{m_x kT}{2\pi\hbar^2}\right)^{3/2} \exp\left(\frac{-m_x c^2 + \mu_x}{kT}\right)^{3/2}$ 

### **ASTR/PHYS 4080: Introduction to Cosmology**

Saha Equation

## **Recombination** $H + \gamma \rightleftharpoons p + e^{-}$

$$\frac{n_H}{n_p n_e} = \frac{g_H}{g_p g_e} \left(\frac{m_H}{m_p m_e}\right)^{3/2} \left(\frac{kT}{2\pi\hbar^2}\right)^{-3/2} \exp\left(\frac{[m_p + m_e - m_H]c^2}{kT}\right) = \left(\frac{m_e kT}{2\pi\hbar^2}\right)^{-3/2} \exp\left(\frac{R}{kT}\right)$$
Defined as when protons and H atoms are equal:  

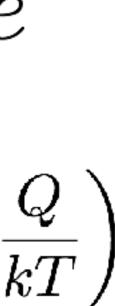

$$X \equiv \frac{n_p}{n_p + n_H} = 1/2$$

$$\frac{1 - X}{X} = n_p \left(\frac{m_e kT}{2\pi\hbar^2}\right)^{-3/2} \exp\left(\frac{Q}{kT}\right) \qquad \eta = \frac{n_p}{Xn_\gamma} \quad , \quad n_\gamma = \frac{2.4041}{\pi^2} \left(\frac{kT}{\hbar c}\right)^3$$
(set by current baryon/photon density)  

$$\frac{1 - X}{X^2} = 3.84\eta \left(\frac{kT}{m_e c^2}\right)^{3/2} \exp\left(\frac{Q}{kT}\right) = S \quad \longrightarrow \quad X = \frac{-1 + \sqrt{1 + 4S}}{2S} \quad \longrightarrow \quad kT_{\rm rec} = \frac{Q}{42}$$

Spring 2021: Week 08

14

### Redshift of recomb., decoupling, & scattering $T = T_0 a^{-1} = T_0 (1 + z)$ time recombination: z = 1380 when T = 3760K $t_{age} = 250,000 \text{ yr}$ .8 decoupling: when expansion rate surpasses .6 ~70,000 yr scattering rate: $\Gamma(z) = H(z)$ $1 + z = \frac{39.3}{X(z)^{2/3}}$ .4 .2 *z* ~ 1090 (incl. non-eq. effects)

**ASTR/PHYS 4080: Introduction to Cosmology** 

last scattering: when the optical depth is ~1 600  $\Gamma(t)dt$  $\tau(t) = \int_t$ 

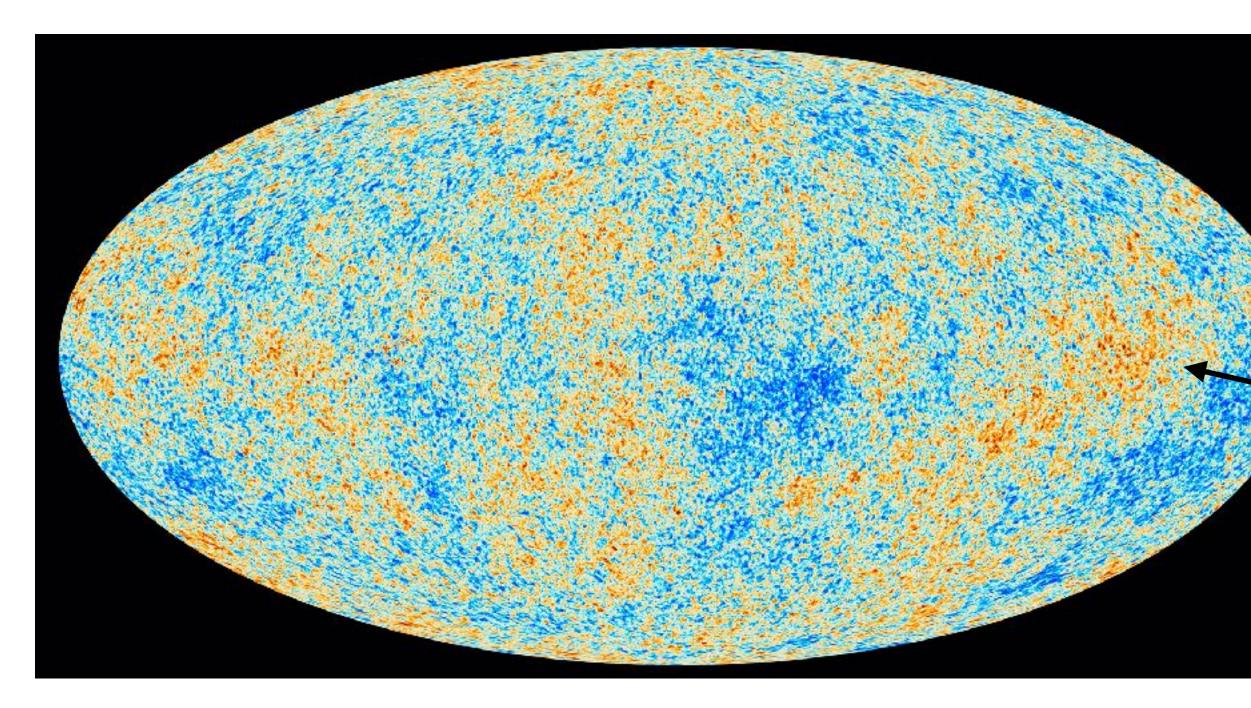

redshift same as decoupling

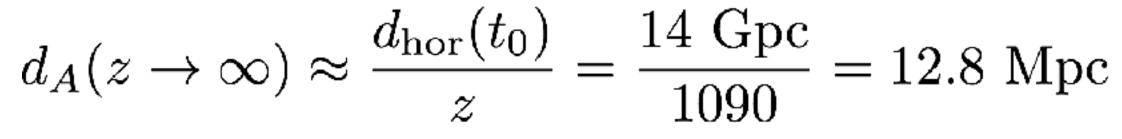

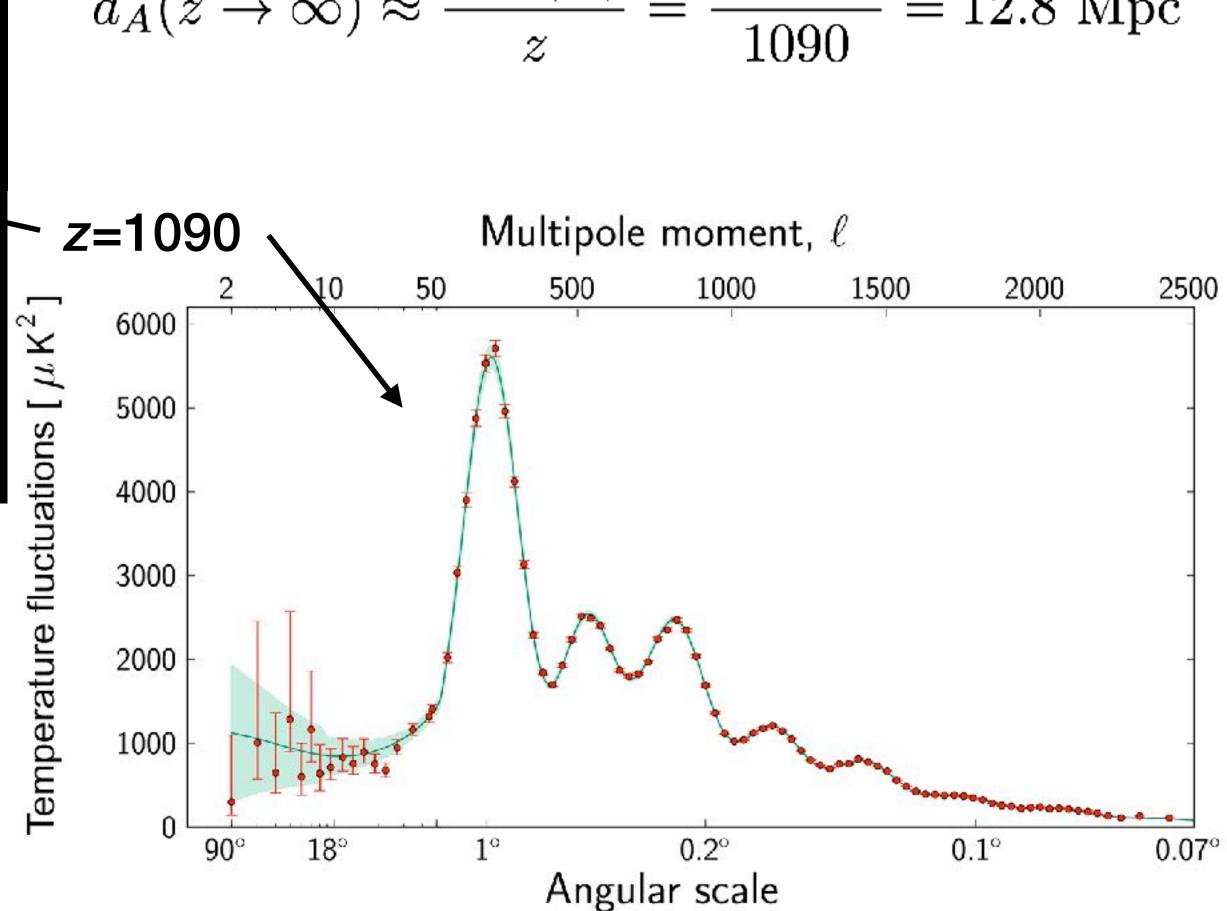

## **Temperature fluctuations**

$$\ell = d_A \cdot \delta \theta = 12.8 \operatorname{Mpc}\left(\frac{\delta \theta}{1 \operatorname{rad}}\right) = 3.7 \operatorname{kpc}\left(\frac{\delta \theta}{1 \operatorname{arcmin}}\right)$$

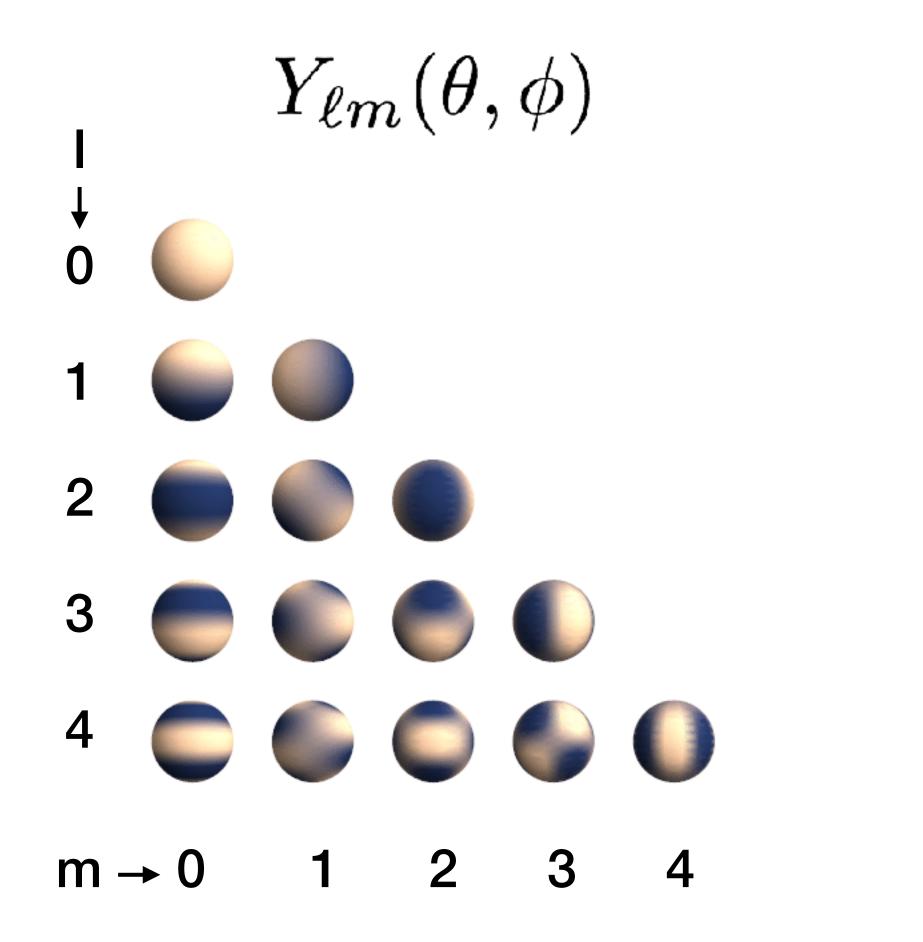

#### **ASTR/PHYS 4080: Introduction to Cosmology**

## **Spherical Harmonics & Power Spectrum**

**ASTR/PHYS 4080: Introduction to Cosmology** 

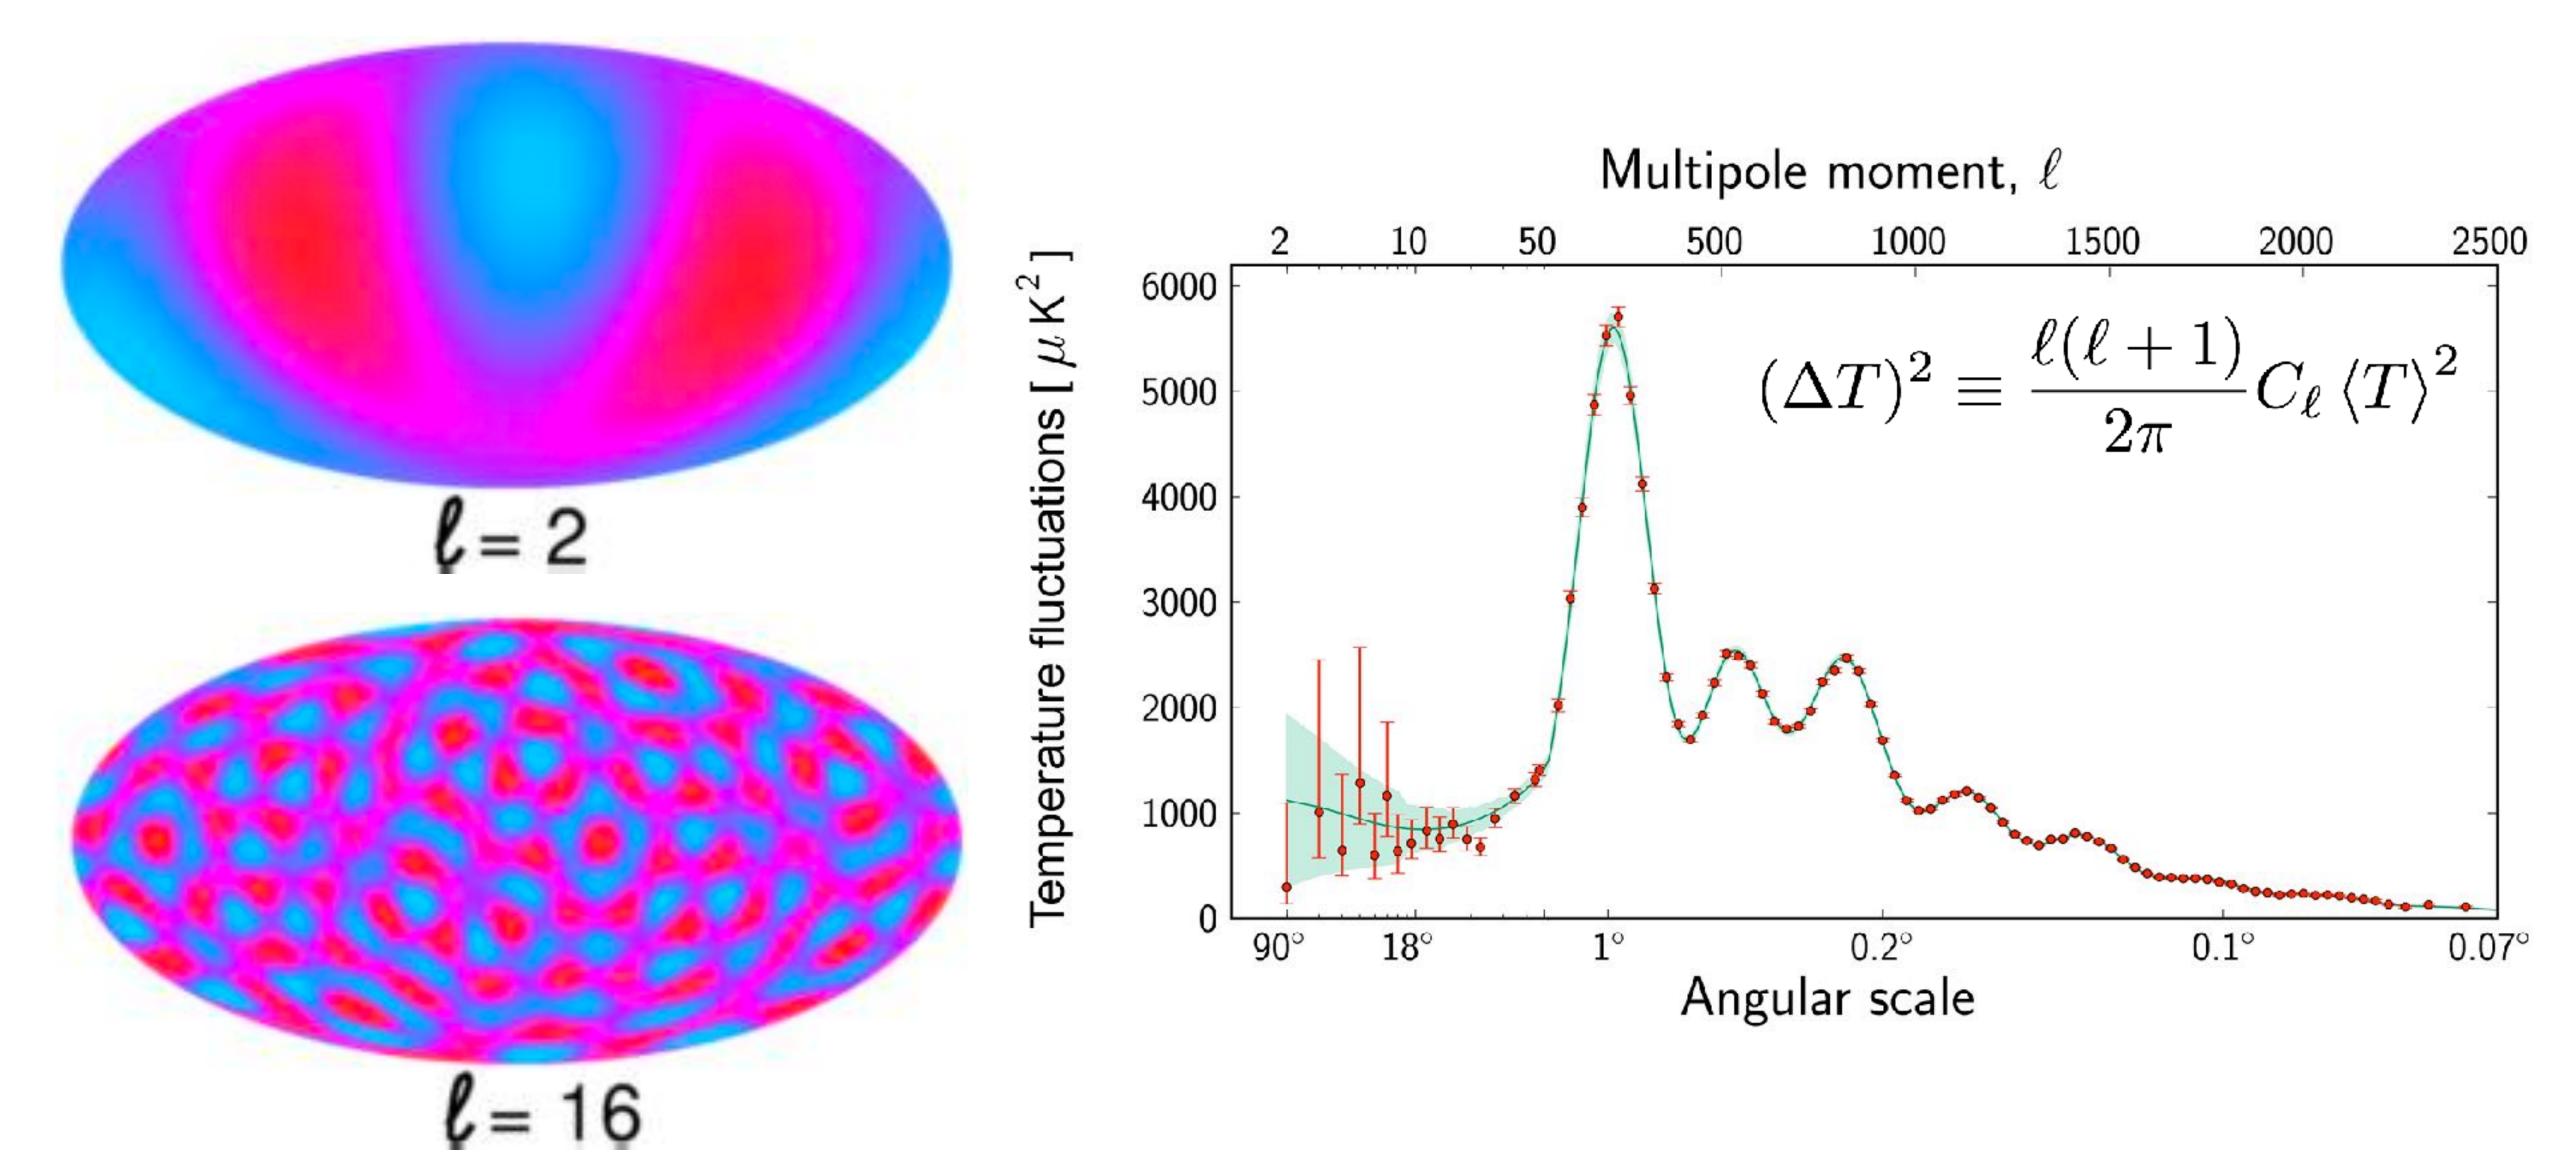

Represent function in terms of spherical harmonics

$$\begin{split} \frac{\delta T}{T}(\theta,\phi) &= \sum_{\ell=0}^{\infty} \sum_{m=\ell}^{\ell} a_{\ell m} Y_{\ell m}(\theta,\phi) \\ \text{sum Y over} \\ \text{n, get} \\ \text{Legend} \\ \text{polyne} \\ C(\theta) &= \left\langle \frac{\delta T}{T}(\hat{n}) \frac{\delta T}{T}(\hat{n}') \right\rangle_{\hat{n} \cdot \hat{n}' = \cos \theta} \\ &= \frac{1}{4\pi} \sum_{\ell=0}^{\infty} (2\ell+1) C_{\ell} P_{\ell}(\cos \theta) \end{split}$$

# (2 point) Correlation function

**ASTR/PHYS 4080: Introduction to Cosmology** 

## Where do the peaks come from?

First, let's define the scale at which pieces of the universe could be in causal contact

At last scattering, universe evolves as if there's only radiation and matter, so we can easily calculate the horizon distance

$$d_{\rm hor}(t_{\rm ls}) = a(t_{\rm ls})c \int_0^{t_{\rm ls}} \frac{dt}{a(t)} = 2.24ct_{\rm ls} \approx 250 \ \rm kpc$$

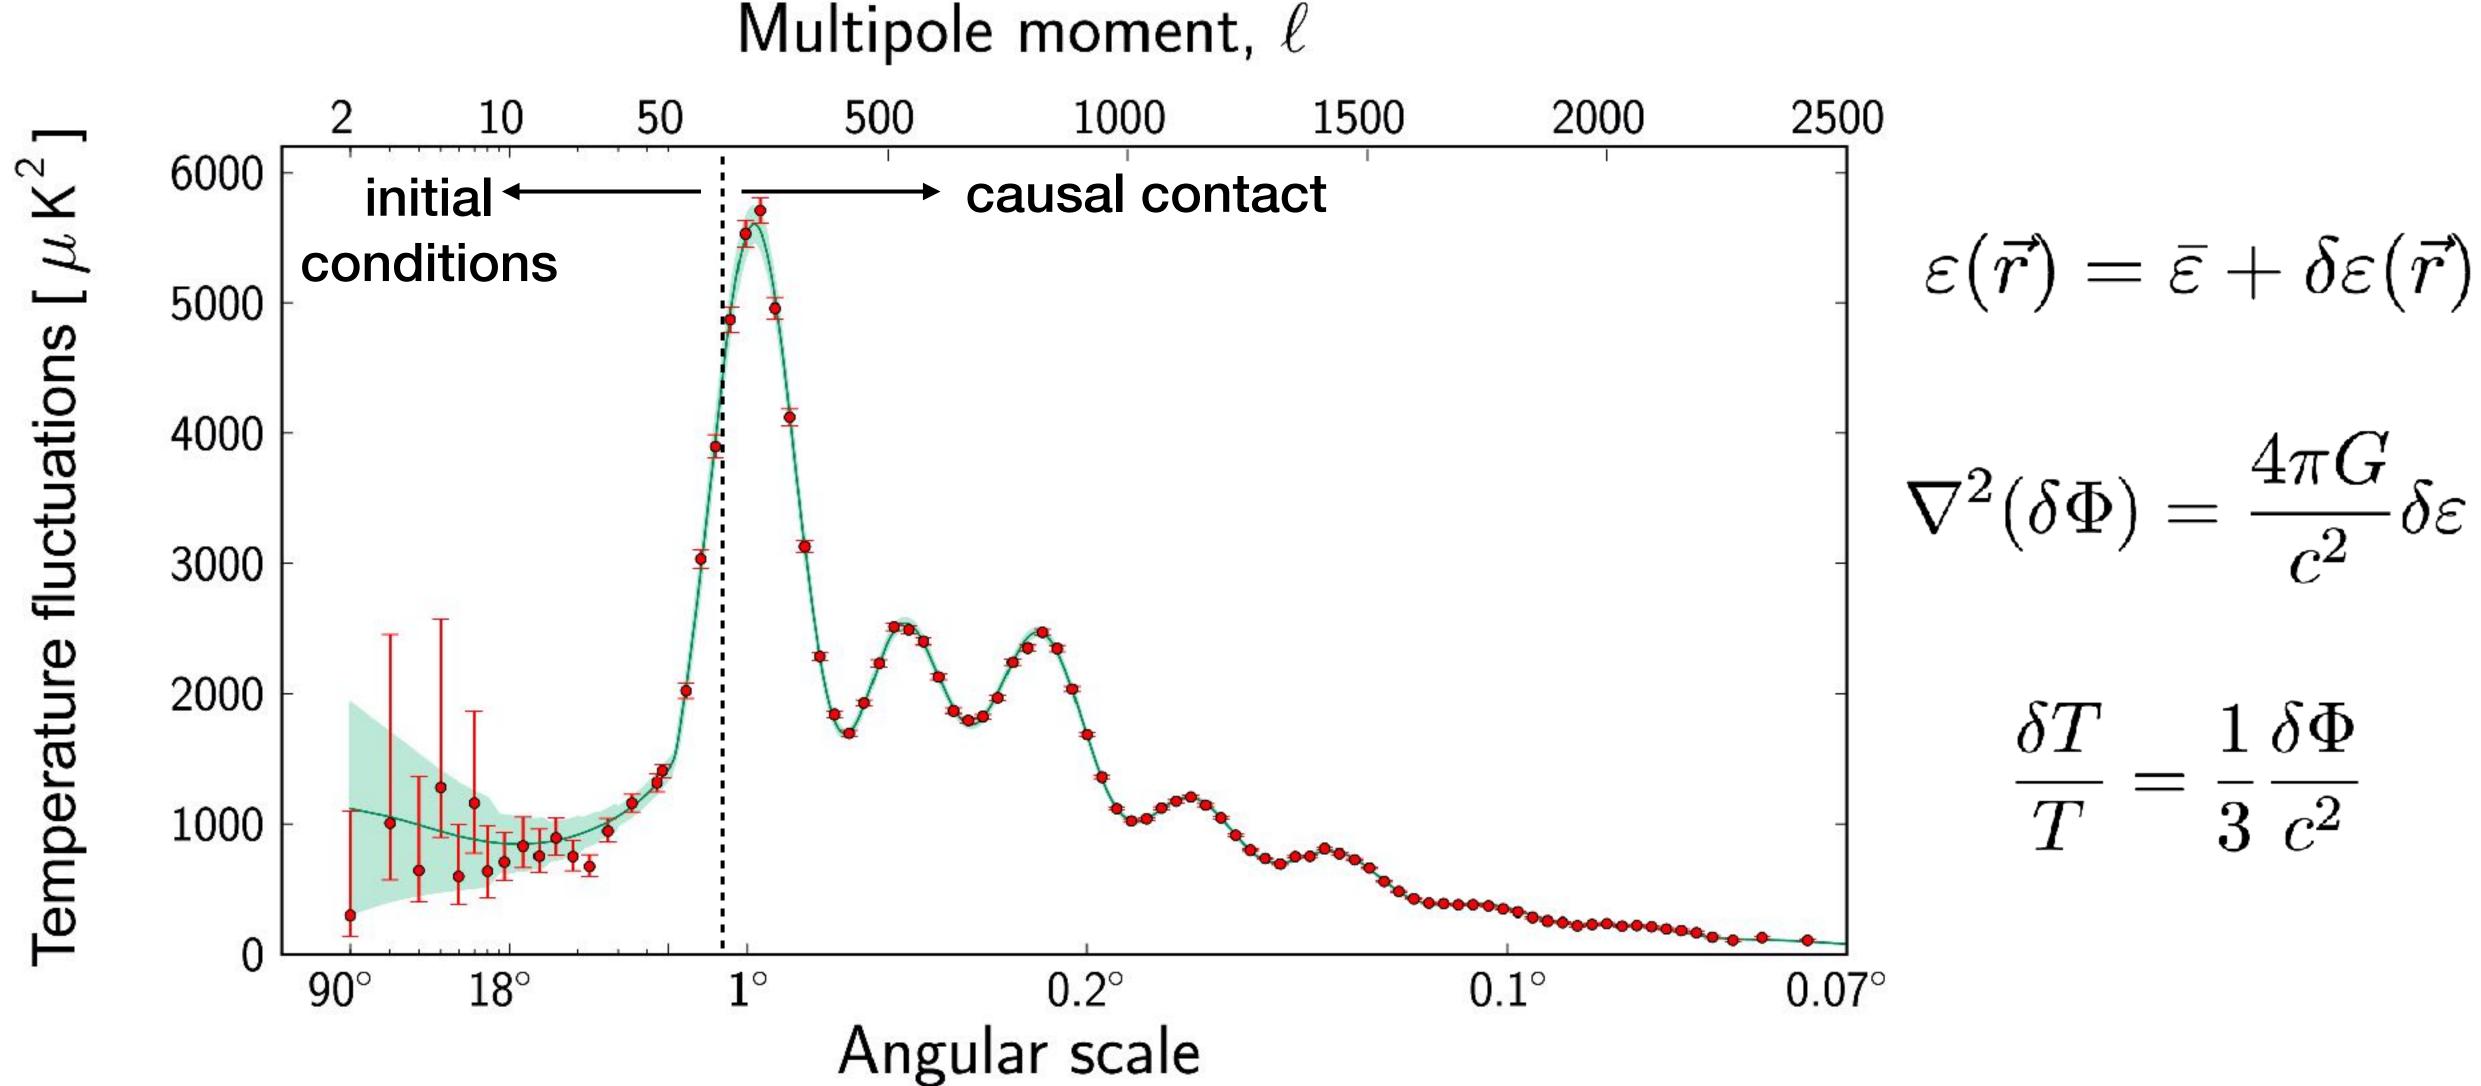

By definition, the angular scale this occurs at is given by the angular diameter distance

$$\theta_{\rm hor} = \frac{d_{\rm hor}(t_{\rm ls})}{d_A} = \frac{250 \text{ kpc}}{12.8 \text{ Mpc}} \approx 1.1^{\circ}$$
